Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	Yes

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	04 September 2018
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	04 September 2018
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The main study objective was to assess the efficacy and safety of 2 doses of Dysport (8 Units per kilogram [U/kg] and 16 U/kg) administered by intramuscular (IM) injection compared to Dysport 2 U/kg (low dose control group) used in the treatment of upper limb spasticity in children.

Protection of trial subjects:

The study was conducted under the provisions of the Declaration of Helsinki in accordance with the International Conference on Harmonisation Guideline on Good Clinical Practice and in compliance with independent ethics committees/institutional review boards and informed consent regulations.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	10 April 2014
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Spain: 9
Country: Number of subjects enrolled	Turkey: 44
Country: Number of subjects enrolled	United States: 63
Country: Number of subjects enrolled	Belgium: 5
Country: Number of subjects enrolled	Czech Republic: 5
Country: Number of subjects enrolled	Israel: 23

Country: Number of subjects enrolled	Poland: 37
Worldwide total number of subjects	210
EEA total number of subjects	56

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23	0

months)	
Children (2-11 years)	143
Adolescents (12-17 years)	67
Adults (18-64 years)	0
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

Male and female subjects aged between 2 and 17 years with upper limb spasticity due to cerebral palsy (CP) were recruited from April 2014 and the study completed in September 2018. Subjects could receive a maximum of 4 treatment cycles (TC) over a minimum of 1 year and maximum of 1 year and 9 months, with at least 16 weeks between each TC.

Pre-assignment

Screening details:

Subjects had a body weight ≥ 10 kg, increased muscle tone/spasticity in at least 1 upper limb, a modified Ashworth scale (MAS) score ≥ 2 in the upper limb primary targeted muscle group (PTMG) of the study limb at baseline. Subjects were stratified according to age (2-9 and 10-17 years) and Botulinum Toxin (BTX) naïve or non-naïve status.

Period 1

Period 1 title	Treatment Cycle 1
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator

Arms

Are arms mutually exclusive?	Yes
Arm title	Dysport 2 U/kg

Arm description:

Subjects were randomised to receive 2 U/kg Dysport by IM injection in the study upper limb in TC 1 and Dysport 8 U/kg or 16 U/kg in subsequent TCs (2, 3 and 4). Retreatment was based on clinical need with a minimum retreatment interval of 16 weeks. From TC 2 onwards dose adaptation was permitted as well as treatment of the non-study upper limb and lower limbs.

Arm type	Control arm
Investigational medicinal product name	Dysport
Investigational medicinal product code	
Other name	Clostridium BTX-A-HAC, AbobotulinumtoxinA
Pharmaceutical forms	Solution for injection
Routes of administration	Intramuscular use

Dosage and administration details:

Subjects received 2 U/kg Dysport by IM injection divided between the PTMG elbow and wrist flexors and other non-PTMG muscles in the study limb.

Arm title	Dysport 8 U/kg
------------------	----------------

Arm description:

Subjects were randomised to receive Dysport 8 U/kg by IM injection into the study upper limb in TC 1 and all subsequent TCs (2, 3 and 4). Retreatment was based on clinical need with a minimum retreatment interval of 16 weeks. From TC 2 onwards dose adaptation was permitted as well as treatment of the non-study upper limb and lower limbs.

Arm type	Experimental
Investigational medicinal product name	Dysport
Investigational medicinal product code	
Other name	Clostridium BTX-A-HAC, AbobotulinumtoxinA
Pharmaceutical forms	Solution for injection
Routes of administration	Intramuscular use

Dosage and administration details:

Subjects received 8 U/kg Dysport by IM injection divided between the PTMG elbow and wrist flexors and other non-PTMG muscles in the study limb, up to maximum dose of 320 U.

Arm title	Dysport 16 U/kg
Arm description:	
Subjects were randomised to receive Dysport 16 U/kg by IM injection into the study upper limb in TC 1 and all subsequent TCs (2, 3 and 4). Retreatment was based on clinical need with a minimum retreatment interval of 16 weeks. From TC 2 onwards dose adaptation was permitted as well as treatment of the non-study upper limb and lower limbs.	
Arm type	Experimental
Investigational medicinal product name	Dysport
Investigational medicinal product code	
Other name	Clostridium BTX-A-HAC, AbobotulinumtoxinA
Pharmaceutical forms	Solution for injection
Routes of administration	Intramuscular use

Dosage and administration details:

Subjects received 16 U/kg Dysport by IM injection divided between the PTMG elbow and wrist flexors and other non-PTMG muscles in the study limb, up to maximum dose of 640 U.

Number of subjects in period 1	Dysport 2 U/kg	Dysport 8 U/kg	Dysport 16 U/kg

Primary: Mean Change from Baseline to TC 1, Week 6 in MAS Score in the TC 1 PTMG

End point title	Mean Change from Baseline to TC 1, Week 6 in MAS Score in the TC 1 PTMG
-----------------	---

End point description:

The MAS was used to assess muscle tone in the upper limb PTMG and consists of 6 grades: 0 (no increase in muscle tone), 1 (slight increase in muscle tone, manifested by a catch and release or by minimal resistance at the end of the ROM) when the affected part is moved in flexion or extension, 1+ (slight increase in muscle tone, manifested by a catch, followed by minimal resistance throughout the remainder (less than half) of the ROM), 2 (more marked increase in muscle tone), 3 (considerable increase in muscle tone) or 4 (affected part(s) rigid in flexion or extension). The original score '+1' was given a derived numeric score of '2' and the higher numeric scores were incremented by 1 so that the MAS score range was from 0 to 5 with higher scores indicating greater muscle tone. A negative change from baseline indicates a decrease in muscle tone.

Statistical analyses

Statistical analysis title	Dysport 8 U/kg vs Dysport 2 U/kg
-----------------------------------	----------------------------------

Statistical analysis description:

The treatment difference between Dysport 8 U/kg and Dysport 2 U/kg was analysed using an analysis of covariance (ANCOVA) on the ranked changes from baseline. The model included treatment group, the baseline value, the 2 stratification factors (age range and BTX status at baseline) and the pooled centre as fixed effects. The derived least squares (LS) means were back transformed to the original scale and the treatment difference determined.

Comparison groups	Dysport 2 U/kg v Dysport 8 U/kg
Number of subjects included in analysis	138
Analysis specification	Pre-specified
Analysis type	superiority
P-value	= 0.0118 ^[1]
Method	ANCOVA

Notes:

[1] - ANCOVA is performed on the ranked values. The 2-tailed significance level was 0.05. LS mean difference, back transformed = -0.4

Notes:

[4] - ANOVA was performed on ranked values. The 2-tailed significance level was 0.05. LS mean difference, back transformed = 0.2.

Secondary: Mean Goal Attainment Scale (GAS) Total Score at TC 1, Week 6

End point title	Mean Goal Attainment Scale (GAS) Total Score at TC 1, Week 6
End point description: The GAS is a functional 5-point scale used to measure progress towards individual therapy goals. At the start of each TC, 1 to 3 individual goals were defined for each subject by the investigator and the child's parents/guardians/caregivers prior to treatment. The outcome to reach each goal was rated on a 5-point scale (-2: much less than expected outcome, -1: somewhat less than expected outcome, 0: expected outcome, 1+: somewhat more than expected outcome, 2+: much more than expected outcome). A total GAS score was calculated taking into account the post-baseline outcome of each goal as well as the importance and difficulty of the goals and transformed into a standardised measure (T score). Therefore a score of 50 indicates that all individual goals had the expected outcome.	
End point type	Secondary

Other pre-specified: Mean Change from Baseline to TC 1 Week 16 in MAS score in the TC 1 PTMG

End point title	Mean Change from Baseline to TC 1 Week 16 in MAS score in the TC 1 PTMG
-----------------	---

End point description:

The MAS was used to assess muscle tone in the upper limb PTMG and consists of 6 grades: 0 (no increase in muscle tone), 1 (slight increase in muscle tone, manifested by a catch and release or by minimal resistance at the end of the ROM) when the affected part is moved in flexion or extension, 1+ (slight increase in muscle tone, manifested by a catch, followed by minimal resistance throughout the remainder (less than half) of the ROM), 2 (more marked increase in muscle tone), 3 (considerable increase in muscle tone) or 4 (affected part(s) rigid in flexion or extension). The original score '+1' was given a derived numeric score of '2' and the higher numeric scores were incremented by 1 so that the MAS score range was from 0 to 5 with higher scores indicating greater muscle tone. A negative change from baseline indicates a decrease in muscle tone. Data is presented for the mITT population.

Adverse events

Adverse events information

Timeframe for reporting adverse events:

Treatment emergent adverse events (TEAEs) were collected from the first injection of study treatment up to the end of TC 4 (up to 21 months).

Adverse event reporting additional description:

TEAEs are reported for the dose received prior to onset of the AE. Due to dose adaptation due to safety lower doses were permitted for TCs 2 - 4.

Assessment type	Systematic

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
24 July 2017	<ul style="list-style-type: none">- Change in the statistical analysis of the primary efficacy endpoint and the first secondary efficacy endpoint: MAS and PGA are ordinal scales. The sponsor proposed as primary efficacy analysis an ANCOVA analysis that instead were based on ranked MAS change from Baseline/PGA scores to better normalise the data. For sensitivity analysis, the sponsor proposed to use a proportional odds cumulative logit model that avoids scoring and retains the ordered nature of the data.-Clarification on efficacy endpoints list: those performed using the treatment cycle baseline were removed. They were replaced by endpoints for the subsets of subjects having kept the same PTMG throughout the study.-Clarification on subgroups analysis: notably those concerning physiotherapy and occupational therapy.-New subgroups added: analysis by gender for the primary and first secondary efficacy endpoints.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
