

Clinical trial results:

Prospective, randomized, placebo-controlled, double-blind, multicenter, parallel-group study to assess the efficacy, safety, and tolerability of macitentan in patients with ischemic digital ulcers associated with systemic sclerosis (DUAL-1)

Summary

EudraCT number	2010-022710-77
Trial protocol	DE HU CZ DK BG FI IT PL
Global end of trial date	29 November 2013

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	20 January 2014
Is this the analysis of the primary completion data?	Yes
Primary completion date	29 November 2013
Global end of trial reached?	Yes
Global end of trial date	29 November 2013
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

To demonstrate the effect of macitentan on the reduction of the number of new digital ulcers in patients with systemic sclerosis and ongoing digital ulcer disease.

Protection of trial subjects:

This study was conducted in full conformance with the principles of the 'Declaration of Helsinki', with the ICH Guidelines on Good Clinical Practice (GCP), and with the laws and regulations of the country in which the research was conducted.

Written informed consent was obtained from each individual participating in the study prior to any study procedure and after adequate explanation of the aims, methods, objectives, and potential hazards of the study. It was made clear to each subject that he or she was completely free to refuse to enter the study, or to withdraw from it at any time for any reason.

A 3-member Independent Data Monitoring Committee (IDMC) reviewed unblinded efficacy and safety data on a regular basis to ensure patient safety. The IDMC was empowered to recommend modifications to the protocol to enhance patient safety or early termination of the study if major concerns arose regarding patient safety at any time during the course of this or any other study with macitentan.

An independent International Liver Safety Board (ILSB), an external expert committee of 3 hepatologists organized by Actelion Global Drug Safety (GDS), provided assessment and advice regarding hepatic events at the request of the Sponsor.

Background therapy:

Allowed concomitant therapy

- Patients' usual treatments for DUs. Treatments with vasodilators (including calcium channel blockers, ACE-inhibitors, nitroglycerin, alpha adrenergic blockers, angiotensin II receptor antagonists), N-acetylcysteine, antiplatelet aggregation therapy, and low molecular weight heparin were to be administered at a stable dose for at least 2 weeks prior to screening and during Period 1. During Period 2, dose adjustments of these treatments were discouraged but may have been justified for the treatment of Raynauds phenomenon.
- Analgesics given for DU pain or for any other reason. Receipt of analgesics and any dose adjustments during the study was to be recorded in a patient diary.
- Topical treatments for DUs such as antiseptics, antibiotics, nitrate ointment, protective ointments, etc. (except for growth factors, hyperbaric oxygen). Topical treatments were to be recorded in the concomitant medication section of the eCRF.
- Statins (e.g., atorvastatin, simvastatin) that had been administered at a stable dose for at least 3 months prior to screening and were to remain unchanged during the study.
- Disease modifying treatments (e.g., methotrexate, cyclophosphamide) that had been administered for at least 3 months and at a stable dose for at least 1 month prior to screening and was to remain unchanged during the study.
- Systemic antibiotics (oral or i.v.). Systemic antibiotics for the treatment of DUs within the 4 weeks prior to screening was an exclusion criterion to exclude patients who had recalcitrant, chronic, hard-to-heal ulcers that were not amenable to healing. However, during the study, systemic antibiotics were allowed. Initiation of systemic antibiotics for the treatment of infection attributed to DUs was reported as a DU complication.

Evidence for comparator: -

Actual start date of recruitment	11 January 2012
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	245
From 65 to 84 years	44
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

Conducted at 70 centers in 17 countries. First patient randomized was 11 January 2012 and last patient, last visit was 29 November 2013.

Pre-assignment

Screening details:

A screening visit was performed between Day -14 and Day -1 of the study. Of the 327 patients screened for the study, 38 were screen failures.

Period 1

Period 1 title	Period 1: Baseline to Week 16
Is this the baseline period?	No
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Monitor, Data analyst, Carer

Blinding implementation details:

To ensure double-blind conditions, each dose strength of the investigational drug and its matching placebo were indistinguishable with respect to appearance, taste, weight, and shape, and all medication bottles were identically packaged and labeled

Arms

Are arms mutually exclusive?	Yes
Arm title	Macitentan 3 mg

Arm description:

macitentan 3 mg once daily

Arm type	Experimental
Investigational medicinal product name	Macitentan 3 mg
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

3 mg tablet once daily

Arm title	Placebo
------------------	---------

Arm description:

Notes:

[2] - The number of subjects starting the period is not consistent with the number completing the preceding period. It is expected the number of subjects starting the subsequent period will be the same as the number completing the preceding period.

Justification: The Section "Subject disposition" does not allow sufficient flexibility to accurately reflect the study design, sequence of periods, and flow of subject numbers. The periods defined in this section, however, also serve as reference points for the subsequent presentation of results (Section Endpoints).

Subject analysis sets

Subject analysis set title	Full analysis set
Subject analysis set type	Full analysis

Subject analysis set description:

This analysis set included all randomized patients as identified in the IVRS dataset. Assignment to treatment arms was as randomized, regardless of the treatment received. This analysis set was added in the SAP to use for the main analysis of the primary endpoint, in line with the intention-to-treat principle as per ICH E9.

Subject analysis set title	Per-protocol (PP) set
Subject analysis set type	Per protocol

Subject analysis set description:

This analysis set comprised all patients in the mITT set until the occurrence of a major protocol deviation that affected the evaluation of the effect of study treatment on the primary endpoint. The protocol deviations affecting this set were identified before database lock.

Patients were excluded from the PP set if they did not meet any of the following entry criteria:

- Diagnosis of limited or diffuse SSc according to the ACR classification or met the criteria for CREST syndrome.
- Active DU according to protocol-defined qualifications.
- History of at least 1 additional active ischemic DU up to 6 months, or at least 2 up to 12 months prior to screening.
- No DUs due to conditions other than SSc.
- No comorbidities, other than SSc, that could seriously affect the assessment of hand function.

In addition, patients who received a study treatment different from that randomized were excluded from the PP set.

Measurements after the occurrence of any of the following deviations in study

Subject analysis set title	Modified intent-to-treat (mITT) set
Subject analysis set type	Modified intention-to-treat

Subject analysis set description:

This analysis set included all patients in the Full analysis set who received at least one dose of study treatment and had at least one post-baseline primary efficacy assessment (i.e., an on-treatment post-baseline DU assessment during Period 1). Assignment to treatment arms was as randomized, regardless of the actual treatment received

Subject analysis set title	Safety set
Subject analysis set type	Safety analysis

Subject analysis set description:

This analysis set included all patients who received at least one dose of study treatment (definition modified with Amendment 2. Assignment to treatment arms was as treated, regardless of the randomization allocation, according to the following algorithm:

- Patients who were dispensed macitentan 10 mg at least once were assigned to the macitentan 10 mg arm.
- Patients who were dispensed macitentan 3 mg at least once, but not macitentan 10 mg, were assigned to the macitentan 3 mg arm.

Primary: Cumulative number of new digital ulcers (DUs) up to week 16 (NB-2 model adjusted)

End point title	Cumulative number of new digital ulcers (DUs) up to week 16 (NB-2 model adjusted)
-----------------	---

End point description:

DUs were assessed at each visit starting with the screening visit. Only DUs from the proximal interphalangeal joint distally (both on the dorsal and volar surface of the hand, including the digital tip) were recorded. The location of each DU was noted. At each subsequent visit the location of each new DU was noted. DUs that occurred and healed between visits and were reported by patients were not recorded as new DUs. The evaluation was performed by an experienced physician or a trained rater with expertise in the assessment of DUs. For a given patient, DUs were assessed by the same rater at each visit, whenever possible. Any DU that developed over a previously healed ulcer was recorded as a new DU. Incidence rate is adjusted for 16 weeks of observation, hence is calculated as the number of new DUs/total number of observation days. Note that NB-2 model estimates are presented. Measures are adjusted by the stratification factor (number of DUs at BL ≤ 3 vs > 3) by the model.

Secondary: Percentage of participants with at least one DU complication

End point title	Percentage of participants with at least one DU complication
-----------------	--

End point description:

DU complications were defined as any one of the following, resulting from DU worsening: critical ischemic crisis necessitating hospitalization; gangrene, (auto)amputation; failure of conservative management; surgical and chemical sympathectomy, vascular reconstructions, or any unplanned surgery in the management of hand SSc manifestations; use of parenteral prostanoids; use of endothelin-receptor antagonists; class II, III, or IV narcotics or a > 50% increase in the existing dose compared with baseline; initiation of systemic antibiotics for the treatment of infection attributed to DUs.

End point type	Secondary

Secondary: Change in Hand Functionality Health Assessment Questionnaire – Disability Index (HAQ-DI) Hand Component from baseline to Week 16

End point title	Change in Hand Functionality Health Assessment Questionnaire – Disability Index (HAQ-DI) Hand Component from baseline to Week 16
-----------------	--

End point description:

HAQ-DI assesses functional ability regarding fine movements of the upper extremities, locomotor activities in the lower extremities, and movements of the upper and lower limbs. Responses were extracted from the Scleroderma Health Assessment Questionnaire covering 8 domains of functional disability (dressing and grooming, arising, eating, walking, hygiene, reach, grip, and other daily activities). A mean score ranging from 0-3 was calculated for each domain, and a composite score by dividing the summed domain scores by the number of domains. The composite score was interpreted as 0 (no impairment in function) to 3 (maximal impairment of function). Hand functionality was assessed using a composite of 4 domains (dressing and grooming, grip, hygiene, and eating). Note that the last observation carried forward (LOCF) approach was applied for Week 16 data.

Adverse events

Adverse events information

Timeframe for reporting adverse events:

From start of study treatment up to 30 days after treatment discontinuation, up to approximately 90 weeks.

Adverse event reporting additional description:

Safety analysis set. One patient was excluded in the safety analysis set as the patient did not receive study drug after randomisation.

Assessment type	Systematic

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? No

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

Mean number of new DUs over 16 wks was lower than historic observations. Up to 60% of pts did not develop any new DUs. Epidemiology of DUs in SSc may be changing, reflective of earlier diagnosis, better wound care, greater availability of treatments.
