

Clinical trial results:

INTERNATIONAL RANDOMIZED PHASE II TRIAL OF THE COMBINATION OF VINCRISTINE AND IRINOTECAN WITH OR WITHOUT TEMOZOLOMIDE (VI OR VIT) IN CHILDREN AND ADULTS WITH REFRACTORY OR RELAPSED RHABDOMYOSARCOMA

Summary

EudraCT number	2010-023135-42
Trial protocol	FR NL ES GB IT
Global end of trial date	25 June 2019

Results information

Result version number	v1 (current)
This version publication date	10 May 2024
First version publication date	10 May 2024

Notes:

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	12 April 2019
Is this the analysis of the primary completion data?	Yes
Primary completion date	24 April 2018
Global end of trial reached?	Yes
Global end of trial date	25 June 2019
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

To evaluate the efficacy of the combination of temozolomide with vincristine and irinotecan in children and adult patients with refractory or relapsed rhabdomyosarcoma as assessed by confirmed objective tumor response after 2 courses

Protection of trial subjects:

This study will be conducted in accordance with the ethical principles of the 1964 Helsinki declaration, revised in 2013 in Fortaleza, with the rules of Good Clinical Practice (GCP) defined by the International Conference on Harmonization (ICH-E6, 17/7/96). The clinical trial may not begin before approval of the Ethics Committees and authorization by competent authorities concerned is obtained.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	15 June 2011
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Netherlands: 16
Country: Number of subjects enrolled	Spain: 2
Country: Number of subjects enrolled	United Kingdom: 34
Country: Number of subjects enrolled	France: 57
Country: Number of subjects enrolled	Italy: 11
Worldwide total number of subjects	120
EEA total number of subjects	86

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	2
Children (2-11 years)	60

Adolescents (12-17 years)	32
Adults (18-64 years)	26
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

The trial was opened in 37 centres, from five countries (France, United Kingdom, Netherland, Italy, Spain). 120 patients were enrolled from 14.03.2012 to 06.04.2018.

Pre-assignment

Screening details:

Firstly, 80 patients were included between 14.03.2012 and 19.06.2014. As preliminary results indicated that more precision was needed, 40 additional patients in the relapse status have been enrolled between 17.06.2016 and 06.04.2018, up to 120 patients (60 patients in the VI arm and 60 patients in the VIT arm).

Period 1

Period 1 title	Overall trial (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	Arm VI

Arm description:

The treatment was given every 3 weeks.

Vincristine was given by intravenous infusion on day 1 and day 8 of each course before irinotecan
Irinotecan was given by intravenous infusion on day 1 and day 5 of each course.

Arm type	Active comparator
Investigational medicinal product name	Vincristine
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for infusion
Routes of administration	Infusion

Dosage and administration details:

1.5 mg/m² or 0.05 mg/kg for patient ≤ 10 kg (maximum 2.0 mg) on day 1 and 8 of each course (every 3 weeks)

Investigational medicinal product name	Irinotecan
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for infusion
Routes of administration	Infusion

Dosage and administration details:

50 mg/m²/day given intravenously infusion over 1 hour on days 1-5 of each course (every 3 weeks)

Arm title	Arm VIT
------------------	---------

Arm description:

The treatment was given every 3 weeks.

Vincristine was given by intravenous infusion on day 1 and day 8 of each course before irinotecan
Irinotecan was given by intravenous infusion on day 1 and day 5 of each course, one hour following the administration of temozolide (TMZ).
TMZ was given orally, prior to vincristine and irinotecan, on days 1-5 repeated.

Arm type	Experimental
----------	--------------

Investigational medicinal product name	Vincristine
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for infusion
Routes of administration	Infusion

Dosage and administration details:

1.5 mg/m² or 0.05 mg/kg for patient ≤ 10 kg (maximum 2.0 mg) on day 1 and 8 of each course (every 3 weeks)

Investigational medicinal product name	Irinotecan
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for infusion
Routes of administration	Infusion

Dosage and administration details:

50 mg/m²/day given intravenously infusion over 1 hour on days 1-5 of each course (every 3 weeks), one hour following the administration of temozolide (TMZ).

Investigational medicinal product name	Temozolide
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Capsule
Routes of administration	Oral use

Dosage and administration details:

The starting dose of TMZ was 125 mg/m²/day. The dose of TMZ was to be escalated to 150 mg/m²/day at cycle 2 for patients who did not experience > grade 3 toxicity of any kind. The dose of TMZ was rounded to the nearest 5 mg. TMZ was given orally, on an empty stomach, prior to vincristine and irinotecan, on days 1-5 repeated every 3-weeks. If the patient vomited within 20 minutes after TMZ, the dose had to be re-administered.

Male	42	32	74

End points

End points reporting groups

Reporting group title	Arm VI
-----------------------	--------

Reporting group description:

The treatment was given every 3 weeks.

Vincristine was given by intravenous infusion on day 1 and day 8 of each course before irinotecan

Irinotecan was given by intravenous infusion on day 1 and day 5 of each course.

Reporting group title	Arm VIT
-----------------------	---------

Reporting group description:

The treatment was given every 3 weeks.

Vincristine was given by intravenous infusion on day 1 and day 8 of each course before irinotecan

Irinotecan was given by intravenous infusion on day 1 and day 5 of each course, one hour following the administration of temozolide (TMZ).

TMZ was given orally, prior to vincristine and irinotecan, on days 1-5 repeated.

Primary: Objective response rate (ORR) after 2 courses of treatment in each arm (VI, VIT)

End point title	Objective response rate (ORR) after 2 courses of treatment in each arm (VI, VIT)
-----------------	--

End point description:

The primary efficacy endpoint is defined as the documented objective response, i.e. complete or partial response, after the first 2 cycles of treatment, based on central radiological review. Responses have been evaluated using the three-dimension WHO response criteria for the primary lesions and according to RECIST 1.1 criteria for metastatic sites. Patients who had a clinical progression reported before 2 cycles with no radiological confirmation of the progression were counted as progressions (all of them died shortly after the diagnosis of progression). A radiological review by the independent radiological experts' committee has been done for 88 cases. For the others, evaluation from the center has been taking into account.

End point type	Primary
----------------	---------

End point timeframe:

From start of treatment to 2 courses of treatment

End point values	Arm VI	Arm VIT		
Subject group type	Reporting group	Reporting group		
Number of subjects analysed	58	55		
Units: Number of participants	18	24		

Statistical analyses

Statistical analysis title	ORR between two arms
----------------------------	----------------------

Statistical analysis description:

A multivariate logistic regression gives the adjusted odds ratio of treatment failure (no objective response) for the VIT arm compared to the VI arm. Model is adjusted on possible confounding factors in the treatment arm effect estimate: histology (non-alveolar vs alveolar), disease staging at study entry (metastatic vs loco-regional) and disease status (refractory vs relapse).

Comparison groups	Arm VIT v Arm VI
Number of subjects included in analysis	113
Analysis specification	Pre-specified
Analysis type	other ^[1]
P-value	= 0.09
Method	Regression, Logistic
Parameter estimate	Odds ratio (OR)
Point estimate	0.5
Confidence interval	
level	95 %

lower limit	0.22
upper limit	1.12

Notes:

[1] - bilateral test

Secondary: Best overall response over the treatment duration in each arm (VI, VIT)

End point title	Best overall response over the treatment duration in each arm (VI, VIT)
-----------------	---

End point description:

Best response recorded from the start of the treatment until disease progression/recurrence (taking as reference for PD the smallest measurements recorded since the treatment started) over the whole treatment duration, using the three-dimension WHO response criteria for the primary lesions and according to RECIST 1.1 criteria for metastatic sites, based on central radiological review when available, and excluding response related to local treatment. Objective response as best response includes complete response and partial response as best response.

End point type	Secondary
----------------	-----------

End point timeframe:

Start of treatment to end of treatment (before local treatment if any)

End point values	Arm VI	Arm VIT		
Subject group type	Reporting group	Reporting group		
Number of subjects analysed	58	58		
Units: Number of participants				
Objective Response	22	33		
Complete Response	4	9		
Partial Response	18	24		
Minor Partial Response	1	3		
Stable Disease	16	13		
Progressive Disease	19	9		

Statistical analyses

Statistical analysis title	Best overall response between two arms
----------------------------	--

Statistical analysis description:

A multivariate logistic regression gives the adjusted odds ratio of non-objective response for the best overall response for the VIT arm compared to the VI arm. Model is adjusted on possible confounding factors in the treatment arm effect estimate: histology (non-alveolar vs alveolar), disease staging at

study entry (metastatic vs loco-regional) and disease status (refractory vs relapse).

upper limit	0.88

Notes:

[2] - bilateral

Secondary: Duration of treatment response in each arm (VI, VIT)

End point title	Duration of treatment response in each arm (VI, VIT)
-----------------	--

End point description:

Overall, 55 patients (22 VI and 33 VIT) had achieved an objective response under study treatment and before local treatment, and are thus evaluable for the duration of response. Duration of response defined as the time from first documentation of objective tumour response to the first objective or clinical documentation of progression, as defined by the radiological review committee when available, based on the information from the treating centre in the other cases. Patients without progression will be censored at the date of death or at the date of last news.

End point type	Secondary
----------------	-----------

End point timeframe:

From first documentation of objective tumour response to date of last news.

End point values	Arm VI	Arm VIT		
Subject group type	Reporting group	Reporting group		
Number of subjects analysed	22	33		
Units: Months				
median (confidence interval 95%)	8.8 (2.5 to 20.1)	12.3 (2.9 to 20.9)		

Statistical analyses

Statistical analysis title	Treatment response between two arms
----------------------------	-------------------------------------

Statistical analysis description:

A multivariate Cox model gives the adjusted hazard ratio of progression after objective response under treatment for the VIT arm compared to the VI arm. Model is adjusted on possible confounding factors in the treatment arm effect estimate: histology (non-alveolar vs alveolar), disease staging at study entry (metastatic vs loco-regional) and disease status (refractory vs relapse).

[3] - bilateral test

Secondary: Progression-free survival (PFS) in each arm (VI, VIT)

End point title	Progression-free survival (PFS) in each arm (VI, VIT)
-----------------	---

End point description:

Progression-free survival defined as the time interval from the date of first treatment administration (or date of randomization for untreated patients) to the date of first objective or clinical documentation of tumour progression or death due to any cause. Patients alive without progression will be censored at the date of last news. Progression was defined according to WHO criteria for the primary tumour and RECIST 1.1 criteria for metastatic sites, based on central review when available, on the evaluation from the treating centre in the other cases. Patients who had a clinical progression according to the treating physician with no radiological confirmation of the progression but who died shortly after the diagnosis of progression were counted as progressions at the corresponding date.

End point type	Secondary
----------------	-----------

End point timeframe:

Start of treatment (or date of randomization for untreated patients) to date of last news.

End point values	Arm VI	Arm VIT		
Subject group type	Reporting group	Reporting group		
Number of subjects analysed	58	60

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
15 July 2011	International amendment n°1 of 15-July-2011 (VHP procedure: the date refers to the date of preparation of the text submitted to VHP): 1. As requested by the National Cancer Research Network (NCRN), several clarifications and modifications that could impact directly on patient safety have been added on the protocol. 2. Removal of the pharmacogenetic study, mainly due to lack of funding 3. Update of international trial site list
28 February 2012	International amendment n°2 of 4-May-2012 (VHP procedure): Changes in the protocol: - addition of a selection criteria and dose adjustments required in case of bone marrow disease - new instructions about the management of vincristine : definition of the dose level -1 (-50%), and dose reduction to be respected in case of grade 3 or 4 peripheral neurotoxicity - introduction of country-specific guidelines which describe the management of temozolomide and Cefixime in The Netherlands, and the administration of temozolomide to patients from UK who have difficulties swallowing capsules - changes in SAE reporting (all SAE should be reported to the sponsor, and pregnancies should be reported immediately as SAE to the sponsor during treatment and up to 6 months after the last administration, a period during which a method of contraception is required)
30 January 2014	International amendment n°3 of 30-Jan-2014 (VHP procedure): 1. Update of the safety reference document (SPC) of temozolomide 2. Changes in of the protocol: addition of recommendations in case of liver abnormalities according to the new version of the SPC of temozolomide
27 January 2015	International amendment n°4 of 27-Jan-2015 (VHP procedure): Changes in the protocol: - an interim analysis was performed on 80 patients being treated or on follow-up, and preliminary results about efficacy and safety have been presented to an Independent Data Monitoring Committee (IDMC) and to the Steering Committee (SC) who both recommended to continue the trial and to increase the number of subjects by 40 extra patients with recurrent RMS. This amendment was submitted to follow this recommendation, and to randomize additional patients according to prior radiotherapy (yes vs no), country and recurrence (metastatic vs locoregional) due to the importance of these factors on the PFS curve
09 July 2018	International amendment n°5 of 9 July 2018 (non-VHP procedure, the date refers to the date of preparation of the text submitted to all national coordinating centres): 1. Update of the safety reference documents (SPC) of Vincristine an irinotecan ; with changes having an impact on the conduct of the study and the safety of patients 2. Changes in the protocol: - addition of a secondary objective to estimate the relative treatment effect of VIT compared to VI in terms of objective response rate (ORR), PFS and OS, in order to anticipate the future design of FarRMS trial ; statistical considerations are updated according to this new objective - update of the protocol to make it compliant with the new safety reference documents of vincristine and irinotecan - update of Pharmacovigilance guidelines according to the recent french legislation (SAE must be reported immediately) and new sponsor procedures

24 June 2019	International amendment n°6 of 24-June-2019 (non-VHP procedure): Changes in the protocol: - Removal of a withdrawal criterion: "Local therapy after 2nd cycle of study treatment", in line with Steering Committee recommendations to perform analysis on local treatment received after VI/VIT, in order to explain the much larger effect of VIT compared to VI on overall survival than progression-free survival. - Clarification of the Last Visit of the Last Subject (LVLS) timepoint, defined as the last VI/VIT administration followed by 6 months to have relevant data in terms of response after 2 cycles ; in this way, the study end date corresponds to the last database export, and is the same all across countries.
