General information about the trial

Main objective of the trial:

This is a randomized, double-blind, placebo-controlled study to assess the safety and tolerability of V212 when administered to adults with solid tumor malignancy (STM) receiving chemotherapy and to assess the impact of V212 on the development of herpes zoster (HZ) in adults with STM receiving chemotherapy. The primary hypothesis is that vaccination with V212 will reduce the incidence of HZ compared with placebo in adults with STM (lower bound of the 97.5% {one-sided $\alpha=0.0125$ } confidence interval [CI] for the estimated vaccine efficacy in adults with STM be $>25\%$).

Participants with hematologic malignancy (HM) were also enrolled and were to be originally included in the primary and secondary objectives and analyses. After an interim analysis demonstrated clear evidence of futility of V212 in the HM population, enrollment of this population was stopped and all HM-related objectives and analyses were made exploratory and are not reported in this record.

Protection of trial subjects:

This study was conducted in conformance with Good Clinical Practice standards and applicable country and/or local statutes and regulations regarding ethical committee review, informed consent, and the protection of human subjects participating in biomedical research.

Subject disposition

Recruitment

Recruitment details:

Adult participants with a diagnosis of solid tumor malignancy (STM) or hematologic malignancy (HM) were enrolled from 328 sites.

Pre-assignment

Screening details:

Out of 5507 screened participants, 5305 were randomized. Twenty randomized participants were not included in analyses: 19 participants from a single site identified to have major Good Clinical Practice compliance issues and 1 participant that was not vaccinated. Thus, a total of 5285 were included in analyses.

Notes:

[1] - The number of subjects reported to be in the baseline period are not the same as the worldwide number enrolled in the trial. It is expected that these numbers will be the same.

Justification: The number of participants in the baseline period (N=5285) does not match the Worldwide Number enrolled in the trial (N=5305) because 20 randomized participants were excluded from all analyses due to compliance issues (N=19) and not receiving vaccine (N=1).

Primary: Incidence of Confirmed Herpes-Zoster

End point title	Incidence of Confirmed Herpes-Zoster ^[1]
End point description: Clinical criteria for suspected HZ cases were the development of a papular or vesicular rash with a dermatomal or generalized distribution, or in the absence of a rash, clinical suspicion of VZV infection with or without the detection of VZV in diagnostic specimens from blood, cerebrospinal fluid, lung, liver, or other organ. All suspected cases of HZ were subjected to adjudication by the Clinical Adjudication Committee (CAC). Case confirmation was based on skin lesion polymerase chain reaction, if available, or by adjudication of the clinical case description by the CAC, conducted according to the CAC Standard Operations Procedure. This analysis was based on the Modified Intent-to-Treat (MITT) population. The MITT population for this outcome measure included all randomized participants in the STM population who received at least one dose of vaccination. This endpoint was exploratory for the HM population, therefore that group was not included in this analysis.	
End point type	Primary
End point timeframe: Up to approximately 5 years	

Notes:

[1] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period. Justification: This endpoint does not report data for all arms in the baseline period because it was considered exploratory for the V212-HM and Placebo-HM arms.

Primary: Percentage of Participants with One or More Serious Adverse Events

End point title	Percentage of Participants with One or More Serious Adverse Events ^[3]
End point description: An adverse event (AE) is defined as any unfavorable and unintended change in the structure, function, or chemistry of the body temporally associated with the use of the sponsor's product, whether or not considered related to the use of the product. A serious adverse event (SAE) is an AE that results in death, is life threatening, results in a persistent or significant disability or incapacity, results in or prolongs an existing hospitalization, is a congenital anomaly or birth defect, is a cancer, is an overdose, or is another important medical event. The analysis population included all participants who received ≥1 dose of vaccination or placebo and had safety follow-up. Three participants in the STM population were cross-treated, these participants were excluded from the safety analyses. This endpoint was exploratory for the HM population, therefore that group was not included in this analysis.

Secondary: Incidence of Moderate to Severe Herpes-Zoster-Associated Pain

End point title	Incidence of Moderate to Severe Herpes-Zoster-Associated
-----------------	--

End point description:

Moderate to severe HZ-associated pain was defined as 2 or more occurrences of a score of 3 or greater (0-to-10 scale, where 0 is no pain and 10 is pain as bad as you can imagine) on the Zoster Brief Pain Inventory (ZBPI) at any time from HZ onset through the end of the 6 month HZ-follow-up period.

This analysis was based on the MITT population. The MITT population for this outcome measure included all randomized participants in the STM population who received at least one dose of vaccination. This endpoint was exploratory for the HM population, therefore that group was not included in this analysis.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
09 January 2012	Protocol Amendment (AM1) 1 modified the statistical criterion for success as related to the secondary clinical efficacy objective of the incidence of HZ in STM and HM populations, by increasing the lower bound of the 95% CI from >0% to >10%.
21 December 2012	Protocol AM3 allowed the inclusion of participants who were receiving or who were expected to require chemotherapy treatment containing an anti-Cellular Differentiation (CD)20 monoclonal antibody (beginning 3 months before enrollment through 28 days Post vaccination 4). The relevant sections in the protocol were modified accordingly to allow those participants to be qualified for enrollment.
15 July 2015	Protocol AM4 revised the trial hypothesis, endpoints, and methods for statistical analysis of the primary and secondary efficacy analyses to include only the STM population in response to the first planned interim analysis for futility. Enrollment in the HM arm was stopped and all objectives for the HM population were changed to exploratory. In addition, the target HZ case accrual was updated from 210 to 90 for the STM population, and the requirement for a second interim analysis was removed.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? Yes

Date	Interruption	Restart date
------	--------------	--------------

22 September 2012	<p>The external Data Monitoring Committee (eDMC) Charter identified stopping rules for V212-011 which included a pause in enrollment and/or a pause in the administration of subsequent doses of vaccine and placebo in the event that 2 participants had disseminated Varicella-zoster virus (VZV) that was positive for VZV Oka/Merck vaccine strain. On 21-Sep-2012, the Sponsor received notification from its external testing laboratory that 2 participants in HM population had nonserious AEs of disseminated rash, and lesion specimens were borderline positive for VZV Oka/Merck (vaccine strain) by PCR testing. On 22-Sep-2012 the Sponsor informed trial sites of a temporary pause in enrollment and vaccine administration for V212-011 as a precautionary measure while further investigation of preliminary safety information occurred. On 02-Oct-2012, the eDMC met to review the results of the completed investigation of the laboratory findings. On the basis of the available evidence, the borderline positive Oka/Merck VZV PCR results were likely because of either contamination introduced during the PCR assay or spurious off-target amplification and were interpreted as false-positive PCR results and not true vaccine strain VZV-related outcomes. Thus, on the basis of this review, the eDMC recommended that the Sponsor resume enrollment and vaccine administration, and subsequent communication to the study sites occurred. Although the available evidence suggested that the PCR results were likely false positives for VZV Oka/Merck (vaccine strain), the Sponsor revised the informed consent's risk language and required submission to IRBs/ERCs and recommended that all newly enrolled participants, as well as those who had not yet completed the 4-dose regimen, be consented or re-consented before dosing.</p>	10 October 2012
