End point title	Number of Participants Who Experienced an Event for Time From Randomization to First Occurrence of Cardiovascular Death, Non-fatal Myocardial Infarction, or Non-fatal Stroke (a Composite Cardiovascular Outcome)
End point description: The time from randomization to first occurrence of cardiovascular death, non-fatal myocardial infarction, or non-fatal stroke (a composite endpoint) was evaluated using time-to-event analysis. The primary analysis model was a Cox proportional hazards regression model for the time to the first occurrence of a primary endpoint event, with treatment as a fixed effect using the intent-to-treat population. The number of participants who experienced primary cardiovascular (CV) endpoint event is presented.

[3] - Superiority was declared if the upper limit of the 2-sided 95.33% CI of the hazard ratio was below 1.0 (after adjustment for the interim analysis). Once superiority was achieved for the primary endpoint, multiplicity adjustments using the graphical approach were performed for secondary efficacy endpoints in order to control the overall Type I error rate at a 2-sided alpha level of 0.0467.

End point description:

The time from randomization to first occurrence of cardiovascular death, non-fatal myocardial infarction, or non-fatal stroke (individually) was evaluated using time-to-event analysis via the Cox proportional hazards regression model where response equals treatment. Death from CV causes is defined as a death resulting from an acute myocardial infarction (MI), sudden cardiac death, death due to heart failure, death due to stroke, or death due to other CV causes.
