

Clinical trial results:

LUX-Head & Neck 2 - A randomised, double-blind, placebo-controlled, phase III study to evaluate the efficacy and safety of afatinib (BIBW 2992) as adjuvant therapy after chemo-radiotherapy in primary unresected patients with stage III, IVa, or IVb loco-regionally advanced head and neck squamous cell carcinoma.

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	25 October 2016
Is this the analysis of the primary completion data?	Yes
Primary completion date	12 September 2016
Global end of trial reached?	Yes
Global end of trial date	12 September 2016
Was the trial ended prematurely?	Yes

Notes:

General information about the trial

Main objective of the trial:

The objective was to investigate the efficacy and safety of afatinib over placebo when given as adjuvant therapy after chemo-radiotherapy (CRT) in primary unresected patients with loco-regionally advanced squamous cell carcinomas (LA SCC) stage III or IVa/b of the oral cavity, oropharynx, or hypopharynx, or larynx stage IVa/b with high or intermediate risk of recurrence. The main objective of the trial was to test the superiority of afatinib as adjuvant therapy vs. placebo in terms of disease-free survival (DFS) for this trial patient population.

Protection of trial subjects:

Only subjects that met all the study inclusion and none of the exclusion criteria were to be entered in the study. All subjects were free to withdraw from the clinical trial at any time for any reason given. If a subject continued to take trial medication, close monitoring was adhered to and all adverse events recorded. Rules were implemented in all trials whereby doses would be reduced if required. Thereafter, if further events were reported, the subject would be withdrawn from the trial. Symptomatic treatment of tumour associated symptoms were allowed throughout.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	02 November 2011
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

From 65 to 84 years	196
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

This was a randomised, placebo-controlled, double-blind, parallel arms, multinational phase III trial in which patients were randomised 2:1 to Afatinib or Placebo.

Pre-assignment

Screening details:

All subjects were screened for eligibility to participate in the trial. Subjects attended a specialist site which ensured that they met all strictly implemented inclusion/exclusion criteria. Subjects were not to be entered to trial treatment if any one of the specific entry criteria were violated.

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Monitor

Arms

Are arms mutually exclusive?	Yes
Arm title	Afatinib (BIBW 2992)

Arm description:

Patient received Afatinib film-coated tablets with starting dose 40 mg (milligram)/day and escalation to 50 mg/day and/or reduction to 40, 30 or 20 mg/day according to absence or presence of drug-related adverse events (AEs), orally, once daily for up to 80 weeks or until recurrence / occurrence of second primary tumour, unacceptable side effects, or other reason necessitating withdrawal.

Arm type	Experimental
Investigational medicinal product name	Afatinib (BIBW 2992)
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Film-coated tablet
Routes of administration	Oral use

Dosage and administration details:

Afatinib film-coated tablets with starting dose 40 mg (milligram)/day and escalation to 50 mg/day and/or reduction to 40, 30 or 20 mg/day according to absence or presence of drug-related adverse events (AEs), orally, once daily for up to 80 weeks or until recurrence / occurrence of second primary tumour, unacceptable side effects, or other reason (patients were discontinued after the trial was stopped prematurely by the DMC due to futility) necessitating withdrawal.

Arm title	Placebo
------------------	---------

Arm description:

Patient received placebo matching Afatinib film-coated tablets with matching Afatinib dosage regimen, orally, once daily for up to 80 weeks or until recurrence / occurrence of second primary tumour, unacceptable side effects, or other reason necessitating withdrawal.

Arm type	Placebo
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Film-coated tablet
Routes of administration	Oral use

Dosage and administration details:

Placebo matching Afatinib film-coated tablets with matching Afatinib dosage regimen, orally, once daily for up to 80 weeks or until recurrence / occurrence of second primary tumour, unacceptable side effects, or other reason (patients were discontinued after the trial was stopped prematurely by the DMC due to futility) necessitating withdrawal.

Number of subjects in period 1^[1]	Afatinib (BIBW 2992)	Placebo
Started	411	206
Completed	124	87
Not completed	287	119
Consent withdrawn by subject	52	13
Adverse event, non-fatal	63	9
Other Reasons	111	60
Second primary tumour	4	3
Lost to follow-up	1	1
Primary tumour recurrence	53	32
Protocol deviation	3	1

Notes:

[1] - The number of subjects reported to be in the baseline period are not the same as the worldwide number enrolled in the trial. It is expected that these numbers will be the same.

Justification: Baseline characteristics are based on the patients who were randomised after successfully completing the screening period and received at least one of the trial medication.

lower limit	0.895
upper limit	2.332

Notes:

[9] - p-value (two-sided) from log-rank test stratified by baseline ECOG (0 or 1) and nodal status (N0-N2a or N2b-N3).

Secondary: Patients with improved Health Related Quality of Life (HRQOL)

End point title	Patients with improved Health Related Quality of Life (HRQOL)
-----------------	---

End point description:

HRQoL questionnaires focused on 3 scales: Pain scale from H&N35, Swallowing scale from H&N35 and Global health status/QoL scale from C30. Improvement was defined as a score that improved from baseline by at least 10 points (on the 0-100 point scale) at any time during the study. If a patient had not improved, worsening was defined as a 10-point worsening at any time during the study. Patients who had neither improved nor worsened were considered as stable. Percentages of patients with improvement in HRQoL are presented. Randomised Set (RS): Included all patients who were randomised, regardless of taking investigational treatment (as randomised)

-----------------------	----------------------

Reporting group description:

Patient received Afatinib film-coated tablets with starting dose 40 mg (milligram)/day and escalation to 50 mg/day and/or reduction to 40, 30 or 20 mg/day according to absence or presence of drug-related adverse events (AEs), orally, once daily for up to 80 weeks or until recurrence / occurrence of second primary tumour, unacceptable side effects, or other reason necessitating withdrawal.

Reporting group title	Placebo
-----------------------	---------

Reporting group description:

Patient received placebo matching Afatinib film-coated tablets with matching Afatinib dosage regimen, orally, once daily for up to 80 weeks or until recurrence / occurrence of second primary tumour, unacceptable side effects, or other reason necessitating withdrawal.

Serious adverse events	Afatinib (BIBW 2992)	Placebo	
Total subjects affected by serious adverse events			
subjects affected / exposed	80 / 411 (19.46%)	51 / 206 (24.76%)	
number of deaths (all causes)	62	23	
number of deaths resulting from adverse events	1	0	
Neoplasms benign, malignant and unspecified (incl cysts and polyps)			
Basal cell carcinoma			
subjects affected / exposed	3 / 411 (0.73%)	0 / 206 (0.00%)	
occurrences causally related to treatment / all	0 / 3	0 / 0	
deaths causally related to treatment / all	0 / 0	0 / 0

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
16 November 2011	With the introduction of this amendment, in addition to some clarifications and minor changes in study definitions, or revisions for consistency or to avoid repetitions, the following changes were made. The start of treatment was amended to start as soon as possible after randomisation and preferably on the day of randomisation. Also, tumour recurrence was changed to tumour recurrence/SPT to take into consideration that not all new tumours would be recurrence of previous tumours. Definitions for the evaluation of DILI were added. The central review procedure for imaging data for tumour assessments was clarified.
28 June 2012	With the introduction of this amendment, in addition to some clarifications and minor changes in study definitions, or revisions for consistency or to avoid repetitions, the following changes were made. Patients were eligible if CRT had been completed no longer than 24 weeks before randomisation to allow potential patients to recover from side effects induced by prior CRT, and to allow more time to perform neck dissection after CRT. The definition of NED was further clarified to provide recommendations for the assessment of lymph nodes. The first exclusion criteria (simultaneous HNSCC primaries) was removed. In the primary analysis of DFS, it was clarified that the 2 stratification factors would be included in the Cox model as strata and not as covariates. Sensitivity analyses of the primary endpoint were defined.
11 February 2014	With the introduction of this amendment, in addition to some clarifications and minor changes in study definitions, revisions for consistency or to avoid repetitions, or updates in the afatinib drug profile, the following changes were made. The best response to subsequent anticancer therapy was to be collected. Following a change in sponsor guidelines, after the first FUV (FUV1), SAEs and AESIs were to be reported if considered relevant by the investigator (signs and symptoms of recurrence/SPT were reported until recurrence/SPT had been radiologically confirmed). It was clarified that that neck dissection was allowed prior to CRT as neck dissection is not regarded as tumour resection and thus the overall patient population (primary unresected HNSCC) remained the same. Also, recognising that a patient may need longer time to recover before resuming treatment, patients who had not recovered within 21 days did not have to be discontinued. Instead, it was recommended that study medication be restarted as soon as clinically possible and within 21 days. The reporting period for AEs was clarified due to new guidelines for AE reporting. Due to extended recruitment, the text was revised to show that the first patients in the study would be followed for approximately 6 years rather than 4 years. The planned number of centres was increased from approximately 100 to approximately 200.
17 July 2015	With the introduction of this amendment, in addition to some clarifications and minor changes in study definitions, revisions for consistency or to avoid repetitions, or updating the drug profile for afatinib, the following changes were made. Further endpoints were added (time to loco-regional failure; time to distant failure; occurrence of SPTs). Some details of the primary analysis were revised, and it was to be conducted when approximately 309 patients had tumour recurrence/SPT or died (rather than when 408 patients had tumour recurrence/SPTs or died). The sample size calculation was revised to account for recently published data. It was clarified that since patients were considered having NED at randomisation, samples for biomarker analyses were typically those collected at diagnosis. The definition of DILI was revised following introduction of a new guideline.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

The trial was stopped prematurely due to futility. At that point, 27.7% of patients in the study discontinued study medication prematurely due to study stop.

Notes:
