Results analysis stage

Analysis stage	Final
Date of interim/final analysis	28 January 2021
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	28 January 2021
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

To evaluate the efficacy of YKP3089 when titrated from 50 to 200 milligram per day (mg/day) in reducing seizure frequency when compared to baseline in subjects with partial onset seizures not fully controlled despite their treatment with 1 to 3 concomitant antiepileptic drugs.

Protection of trial subjects:

This study was conducted according to United States and international standards of Good Clinical Practice (Food and Drug Administration Title 21 Part 312 and International Conference on Harmonization guidelines), applicable government regulations and Institutional research policies and procedures.

Background therapy:

Subjects must have been taking 1-3 concomitant antiepileptic drugs, which they continued to take as prescribed, throughout the study. Subjects could not have any dose changes in their current antiepileptic drug therapy for at least 12 weeks prior to randomization, and doses were to remain stable throughout the double-blind treatment period.

Evidence for comparator:

This was a placebo-controlled study and placebo was considered as the comparator.

Actual start date of recruitment	06 July 2011
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	India: 51
Country: Number of subjects enrolled	Korea, Republic of: 41
Country: Number of subjects enrolled	Poland: 44
Country: Number of subjects enrolled	United States: 86
Worldwide total number of subjects	222
EEA total number of subjects	44

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23	0

months)	
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	222
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

This Phase 2 double-blind study with an open-label extension (OLE) was conducted in subjects with treatment resistant partial onset seizures at 40 investigational sites. Investigational sites in India did not participate in the OLE phase. A total of 222 subjects were randomized in a 1:1 ratio to YKP3089 or placebo in this study.

Pre-assignment

Screening details:

The study consisted of a baseline phase (8 weeks), a double-blind treatment period (6-week titration and 6-week maintenance phase), and an OLE phase. The OLE phase was designed without a pre-specified number of weeks. Subject disposition for the double-blind treatment period is based on Randomized Population.

Period 1

Period 1 title	Double-Blind Treatment Period
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Monitor, Carer

Blinding implementation details:

During the double-blind period, the packaging and labeling of the clinical trial medication maintained the double-blind design of the trial. The treatment administered was not known to the subjects or the study personnel at the clinical site. Selected individuals from the Sponsor and/or designee and at the contract research organization (CRO) may have been unblinded to the study treatments on a need-to-know basis as described in the CRO's Standard Operating Procedures on blinding and unblinding.

Arms

Are arms mutually exclusive?	Yes
Arm title	Double-Blind Treatment Period: YKP3089

Arm description:

Subjects received YKP3089 50 mg orally once daily starting on Day 1 for the first 2 weeks. If well tolerated the dose was increased to 100 mg/day for the next 2 weeks. If well tolerated the dose was then increased to 150 mg/day for the next 2 weeks. If well tolerated the dose was then increased to 200 mg/day for the final 6-week maintenance phase. Subjects who reported side effects may, instead of increasing the dose, remained on the same dose (50 mg, 100 mg, or 150 mg) and not titrated until the following visit.

Arm type	Experimental
Investigational medicinal product name	YKP3089
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Capsule, hard
Routes of administration	Oral use

Dosage and administration details:

YKP3089 capsules with dosages described above in Arm description were administered orally once daily in the morning (with or without breakfast) from Day 1 to the end of double-blind treatment period.

Arm title	Double-Blind Treatment Period: Placebo
------------------	--

Arm description:

Subjects received placebo (matching with YKP3089) orally once daily starting on Day 1 and throughout the 6-week titration phase and 6-week maintenance phase.

Arm type	Placebo
----------	---------

Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Capsule, hard
Routes of administration	Oral use

Dosage and administration details:

Placebo (matching with YKP3089) capsules were administrated orally once daily in the morning (with or without breakfast) from Day 1 to the end of double-blind treatment period.

Number of subjects in period 1	Double-Blind Treatment Period: YKP3089	Double-Blind Treatment Period: Placebo
Started	113	109
Completed	102	99
Not completed	11	10
Consent withdrawn by subject	5	4
Adverse event, non-fatal	4	4
Other	-	1
Lost to follow-up	2	-
Protocol deviation	-	1

Period 2

Period 2 title	Open-Label Extension Phase
Is this the baseline period?	No
Allocation method	Not applicable
Blinding used	Not blinded

Arms

Arm title	OLE Phase: YKP3089
-----------	--------------------

Arm description:

Subjects who continued in the OLE phase received YKP3089 100 mg orally once daily starting on Day 1 of the OLE phase (Day 85 of study) and then increased by 50 mg/day increments every 2 weeks until reaching the maximum of 400 mg/day based on the same tolerability requirement used in the double-blind treatment period.

Arm type	Experimental
Investigational medicinal product name	YKP3089
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Capsule, hard, Tablet
Routes of administration	Oral use

Dosage and administration details:

YKP3089 capsules or tablets with dosages described above in Arm description were administrated orally once daily in the morning (with or without breakfast) from Day 1 to the end of OLE phase. The OLE phase could continue until development was stopped by the Sponsor, the product was approved for marketing or anytime at the discretion of the Sponsor. The OLE phase disposition is based on OLE Safety Evaluable Population, which is defined as all subjects treated in double-blind who continued into

OLE phase and took at least 1 dose of open-label study medication.

Number of subjects in period 2^[1]	OLE Phase: YKP3089
Started	149
Completed	37
Not completed	112
Consent withdrawn by subject	31
Adverse event, non-fatal	16
Other	12
Lost to follow-up	5
Pregnancy	1
Entered Extended Access Program/Navigator	47

Notes:

[1] - The number of subjects starting the period is not consistent with the number completing the preceding period. It is expected the number of subjects starting the subsequent period will be the same as the number completing the preceding period.

Justification: Only subjects who completed the double-blind treatment period and still met inclusion/exclusion criteria except for seizure frequency were entered into the OLE phase. Please note, sites from India did not participate in the OLE phase.

Reporting group title	OLE Phase: YKP3089
Reporting group description: Subjects who continued in the OLE phase received YKP3089 100 mg orally once daily starting on Day 1 of the OLE phase (Day 85 of study) and then increased by 50 mg/day increments every 2 weeks until reaching the maximum of 400 mg/day based on the same tolerability requirement used in the double-blind treatment period.	

Primary: Percent Change From Baseline in Seizure Frequency Per 28 Days During Double-Blind Treatment Period

End point title	Percent Change From Baseline in Seizure Frequency Per 28 Days During Double-Blind Treatment Period
End point description: Percent change (reduction) was calculated as (baseline seizure frequency per 28 days – double-blind period seizure frequency per 28 days) / baseline seizure frequency per 28 days x 100. Baseline seizure frequency per 28 Days = number of seizures over baseline period (56 days prior to study Day 1) divided by the number of days in the interval multiplied by 28. The Intention-to-Treat (ITT) population included all randomized subjects who took at least 1 single dose of YKP3089 (or placebo) and had at least 1 efficacy evaluation. The analysis for the primary endpoint is based on ITT population.	
End point type	Primary
End point timeframe: From Day 1 to the end of the double-blind treatment period (Week 12)	

End point values	Double-Blind Treatment Period: YKP3089	Double-Blind Treatment Period: Placebo		
Subject group type	Reporting group	Reporting group		
Number of subjects analysed	113	108		
Units: percent change				
median (full range (min-max))	55.6 (-417.3 to 100.0)	21.5 (-588.0 to 100.0)		

Statistical analyses

Statistical analysis title	Percent Change from Baseline in Seizure Frequency
Comparison groups	Double-Blind Treatment Period: YKP3089 v Double-Blind Treatment Period: Placebo
Number of subjects included in analysis	221
Analysis specification	Pre-specified
Analysis type	superiority
P-value	< 0.0001 ^[1]
Method	Wilcoxon rank-sum test

Notes:

[1] - The p-value is based on a Wilcoxon rank-sum test assessing if the median percent change in seizure frequency for the treatment group is significantly different from the median percent change in seizure frequency for the placebo subjects.

Secondary: Responder Rate (at Least 50% Reduction in Seizure Frequency) During Double-Blind Treatment Period

End point title	Responder Rate (at Least 50% Reduction in Seizure Frequency) During Double-Blind Treatment Period
-----------------	---

End point description:

The main secondary endpoint was the responder rate (responder is defined as a subject with $\geq 50\%$ reduction in seizure frequency during the double-blind treatment period). The ITT population included all randomized subjects who took at least 1 single does of YKP3089 (or placebo) and had at least 1 efficacy evaluation. The analysis for this secondary endpoint is based on ITT population.

End point type	Secondary

Notes:

[4] - The p-value is based on a Wilcoxon rank-sum test assessing if the median seizure frequency at post baseline for the treatment group is significantly different from the median seizure frequency for the placebo subjects.

Adverse events

Adverse events information

Timeframe for reporting adverse events:

Treatment-emergent adverse events (TEAEs) were reported during the double-blind treatment period.

Adverse event reporting additional description:

Adverse events (AEs) that occur up to 7 days following the subject's last dose of double-blind study drug are included as TEAEs. Double-blind safety evaluable population included all randomized subjects who took at least 1 dose of YKP3089 (or placebo). AEs are reporting in Safety evaluable population. Similar AEs data was observed during OLE phase.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
09 May 2011	To amend inclusion/exclusion criteria to allow subjects receiving carbamazepine into the study.
01 November 2011	To add an OLE to obtain long-term safety and tolerability data in subjects with treatment resistant partial onset seizures. To allow subjects under the care of guardians to participate in the study.
28 November 2011	To allow subjects with a body mass index up to 40 to participate in the study.
10 September 2012	To allow subjects to convert from double-blind to open-label treatment without a taper. Clarified exclusion criteria. To provide results of the second carbamazepine - YKP3089 interaction study.
12 November 2012	To allow subjects in the OLE to continue open-label treatment beyond 1 year and also to collect long term safety data for YKP3089.
10 April 2013	To add additional safety assessments for subjects with treatment-emergent rash.
10 October 2013	To provide the results of a multiple ascending dose study that targeted 400, 500 and 600 mg/day doses of YKP3089. To allow subjects in the OLE to increase the target dose up to 400 mg/day.
11 September 2015	To allow subjects in the OLE to take YKP3089 in tablet formulation.
