

Clinical trial results:

A prospective, randomised, open-label phase IIb clinical trial assessing the effect of pegylated Interferon alfa-2a (Pegasys®) 180 µg once weekly for 48 weeks in addition to an ongoing nucleos(t)ide based treatment on quantitative HBsAg levels in patients with chronic HBeAg-negative hepatitis B

Primary completion date	29 March 2018
Global end of trial reached?	Yes
Global end of trial date	29 March 2018
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary objective of the trial is to investigate whether the add-on of pegylated interferon alfa-2a to a continued treatment with nucleos(t)ide analogues increases the percentage of patients who have significant decrease ($\geq 1\log_{10}$) of HBs-antigen after 48 weeks.

Protection of trial subjects:

All patients were insured according to §40 AMG requirements. Assessment of safety and tolerability by documentation of adverse events and serious adverse events. The study fulfills all ethical standards according to the independent ethics committee (IEC), such as GCP, Federal Data Protection Law and the Declaration of Helsinki (DoH). To evaluate safety and tolerability of pegylated interferon alfa-2a when combined with tenofovir, entecavir, lamivudine, adefovir, or a combination of lamivudine or entecavir with adefovir or tenofovir the following data was collected: adverse events, vital signs, physical examination, laboratory test abnormalities, laboratory test value changes over time.

Background therapy:

Treatment with nucleos(t)ides.

Evidence for comparator:

Treatment with nucleos(t)ide analogues partly restores HBV directed immune responses and reduces HBsAg levels during long-term administration, with the newer drugs being more potent. Therefore the nucleos(t)ides analogues lamivudine, adefovir, entecavir, tenofovir or a combination thereof were chosen as active comparator. Due to the increased neurotoxicity of pegylated interferon alfa-2a when combined with telbivudine in a previous study, use of telbivudine was not allowed.

Recent data further support that interferon treatment is even more effective in preventing HBV associated complications than high potent nucleos(t)ide analogues. This included a better prevention of cirrhosis and hepatocellular carcinoma following interferon treatment compared to an ongoing entecavir therapy. We may speculate that interferon induces a sustaining immunological surveillance of HBV infection, which positively affects long-term prognosis. Other studies have investigated an add-on interferon approach in the setting of HBeAg positive hepatitis B and provide additional evidence for this novel approach. However, stopping stable nucleos(t)ide therapy has emerged as simple and safe alternative to promote HBsAg clearance by an endogenous inflammatory flare during therapy discontinuation.

Actual start date of recruitment	03 September 2012
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Germany: 201
Worldwide total number of subjects	201
EEA total number of subjects	201

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	199
From 65 to 84 years	2
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

Recruitment and treatment of subjects were performed in 24 trial sites in Germany. Originally it was planned to replace patients who dropped out of the study before receiving any trial treatment, but further recruitment was not possible. Therefore not all randomized 170 patients could be included in the mITT population and the primary analysis.

Pre-assignment

Screening details:

There was an individual screening period of approximately 4 weeks. After randomisation, the treatment period took 48 weeks. Follow-up continued for another 24 weeks (72 weeks in total).

Pre-assignment period milestones

Number of subjects started	201
Number of subjects completed	170

Pre-assignment subject non-completion reasons

Reason: Number of subjects	Meeting any exclusion criterion: 15
Reason: Number of subjects	Violation of inclusion criteria: 16

Period 1

Period 1 title	Treatment
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	Intervention Group (Pegasys®)

Arm description:

The group received additional treatment with Pegasys in the following treatment period. After the treatment period, both groups were treated with the standard therapeutic use of Nucleos(t)ides.

Arm type	Experimental
Investigational medicinal product name	pegylated interferon alfa-2a
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection in pre-filled syringe
Routes of administration	Subcutaneous use

Dosage and administration details:

In this trial the dosage and duration of Pegasys® is 180 micrograms once weekly for 48 weeks by subcutaneous administration in the abdomen or thigh which is consistent with the recommended dosage and duration for both HBeAg-positive and -negative chronic hepatitis B. Temporary interruptions of study drug(s) administration are discouraged; patients are to remain on treatment for the entire duration of the trial; and the dose of peg-IFN should not be changed during the trial, unless dose reduction is indicated because of laboratory abnormalities/adverse events (c.f. Section 4.1.8 for instructions for dose reduction). The patients must be counselled regarding the importance of not missing doses of peg-IFN.

Arm title	Control Group
------------------	---------------

Arm description:

Group receiving the standard nucleos(t)ide treatment without the add-on drug [pegylated Interferon alfa-2a (Pegasys®)].

Arm type	Active comparator
----------	-------------------

Investigational medicinal product name	nucleos(t)ides
Investigational medicinal product code	
Other name	amivudine, adefovir, entecavir, tenofovir or one of the following combinations: lamivudine/adeфовir, lamivudine/tenofovir, entecavir/adeфовir or entecavir/tenof
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Dose and administration according to individual summary of product characteristics.

Number of subjects in period 1^[1]	Intervention Group (Pegasys®)	Control Group
Started	112	58
Completed	89	49
Not completed	23	9
Consent withdrawn by subject	4	4
Other(unknown)	6	1
Adverse event, non-fatal	9	-
Other (Unallowed concomitant medication indicated)	1	-
Lost to follow-up	1	4
Other(significant change of medical condition))	2	-

Notes:

[1] - The number of subjects reported to be in the baseline period are not the same as the worldwide number enrolled in the trial. It is expected that these numbers will be the same.

Justification: Baseline values were collected before randomization after a screening procedure.

Period 2

Period 2 title	Follow Up
Is this the baseline period?	No
Allocation method	Not applicable
Blinding used	Not blinded

Arms

Arm title	Intervention Group (Pegasys®)
------------------	-------------------------------

Arm description:

The group received addiotional treatment with Pegasys in the following treatment period. After the treatment period, both groups were treated with the standard therapeutic use of Nucleos(t)ides.

Arm type	Experimental
Investigational medicinal product name	pegylated interferon alfa-2a
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection in pre-filled syringe
Routes of administration	Subcutaneous use

Dosage and administration details:

In this trial the dosage and duration of Pegasys® is 180 micrograms once weekly for 48 weeks by subcutaneous administration in the abdomen or thigh which is consistent with the recommended dosage and duration for both HBeAg-positive and -negative chronic hepatitis B. Temporary interruptions of study drug(s) administration are discouraged; patients are to remain on treatment for the entire

duration of the trial; and the dose of peg-IFN should not be changed during the trial, unless dose reduction is indicated because of laboratory abnormalities/adverse events (c.f. Section 4.1.8 for instructions for dose reduction). The patients must be counselled regarding the importance of not missing doses of peg-IFN.

Number of subjects in period 2^[2]	Intervention Group (Pegasys®)
Started	112
Completed	103
Not completed	9
Administrative/regulatory reasons	2
Consent withdrawn by subject	1
Adverse event, non-fatal	5
other reasons (unspecified)	1

Notes:

[2] - The number of subjects starting the period is not consistent with the number completing the preceding period. It is expected the number of subjects starting the subsequent period will be the same as the number completing the preceding period.

Justification: The numbers from the safety population were used for reporting.

Primary: Objective response after 48 weeks

End point title	Objective response after 48 weeks
End point description: The primary endpoint was the objective response after 48 weeks of combination therapy. The response is defined as a confirmed reduction of $\geq 1 \log_{10}$ in HBsAg compared to baseline. Missing values of the primary variable were carried forward in the main Analysis and the first sensitivity analysis. In the second sensitivity analysis drop-outs before week 48 were considered as non-responders, including patients with missing baseline values.	
End point type	Primary
End point timeframe: The primary endpoint was the objective response after 48 weeks of combination therapy. Objective response is defined as confirmed reduction of $\geq 1 \log_{10}$ in HBsAg compared to baseline.

Adverse events

Adverse events information

Timeframe for reporting adverse events:

In this trial, the period of observation for adverse events extended from the time the subject had signed the informed consent document up to the end of follow up at week 72 (visit 15 of the treatment group or visit 7 of the control group).

Adverse event reporting additional description:

If the investigator detected a serious adverse event after the period of observation, considering the event possibly related to this trial, he should contact the sponsor to determine how the adverse event should be documented & reported. Serious adverse events had to be immediately (within 24h of the investigator's awareness) reported to IZKS Mainz

Assessment type	Non-systematic

Reporting groups

Reporting group title	Intervention Group (Pegasys®)
-----------------------	-------------------------------

Reporting group description:

The group received additional treatment with Pegasys in the following treatment period. After the treatment period, both groups were treated with the standard therapeutic use of Nucleos(t)ides.

Reporting group title	Control Group
-----------------------	---------------

Reporting group description:

Group receiving the standard nucleos(t)ide treatment without the add-on drug [pegylated Interferon alfa-2a (Pegasys®)].

Serious adverse events	Intervention Group (Pegasys®)	Control Group	
Total subjects affected by serious adverse events			
subjects affected / exposed	13 / 112 (11.61%)	4 / 58 (6.90%)

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
22 December 2011	<p>Added following inclusion criteria:</p> <ul style="list-style-type: none">-Treatment with a nucleos(t)ide regimen (lamivudine, adefovir, entecavir, tenofovir or one of the following combinations: lamivudine/adefovir, lamivudine/tenofovir, entecavir/adefovir or entecavir/tenofovir) and a fully suppressed viral load for at least 12 months (below limit of detection in conventional HBV-PCR assays, i.e. <116 copies/ml). <p>Added following exclusion criteria:</p> <ul style="list-style-type: none">-Preexisting polyneuropathy-If polyneuropathy develops and is confirmed by a neurologist, withdrawal will be discussed according to severity of the symptoms <p>Declared the following as secondary objectives:</p> <ul style="list-style-type: none">-To evaluate safety and tolerability of pegylated interferon alfa-2a when combined with tenofovir, entecavir, lamivudine, adefovir, or a combination of lamivudine or entecavir with adefovir or tenofovir. <p>Added the following information to the basic treatment section:</p> <p>The known dosing instructions, contraindications, side effects and risks for each drug must be taken into account according to the manufacturers' recommendations. Regular laboratory and clinical assessments throughout the course of this study are to provide adequate monitoring of potential toxicities.</p> <p>Added the following info on physical examination:</p> <p>As an increased incidence of polyneuropathy was observed during combination therapy with pegylated interferon alfa-2a and telbivudine, special attention should be paid to the development of polyneuropathy or other neurological symptoms in subjects on combination therapy. Investigators need to question patients about development of hyp- or dysesthesia, muscle weakness or any other neurological symptoms. If neurological symptoms occur, they need to be documented as adverse events, and the patients will then be referred to a neurologist for further examination.</p>
19 April 2013	<p>The amendment contains the change of:</p> <ul style="list-style-type: none">- the coordinating investigator- the inclusion criterion "HBsAg ≥ 1000 IU/ml" to "HBsAg ≥ 100 IU/ml"- the following exclusion criteria:- Decompensated liver disease, or history of decompensated liver disease, as evidenced by ascites, portal hypertension, jaundice or hepatic encephalopathy, coagulopathy, varices, history of varicose bleeding, or any other clinical evidence of decompensation. (Patients with stable liver cirrhosis are eligible for this study, if a history of decompensated liver disease as outlined above has been excluded.)-Usage of any investigational drugs within 3 months before enrolment <p>removed: Histologically proven liver cirrhosis (exclusion criteria). Earlier: Usage of any investigational drugs within 12 months before enrolment.</p>

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats
