Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	13 November 2015
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	15 October 2015
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary objective of this 2-cohort, open-label, multicenter, phase 2 study was overall response rates (ORR), assessed by investigator, of pertuzumab given in combination with trastuzumab (Herceptin) and vinorelbine in first line participants with metastatic or locally advanced human epidermal growth factor receptor (HER) 2-positive breast cancer. Participants received pertuzumab and trastuzumab administered sequentially as separate intravenous (IV) infusions (followed by vinorelbine) and conventional sequential administration of pertuzumab and trastuzumab in separate infusion bags, followed by vinorelbine.

Protection of trial subjects:

The study was conducted in accordance with the principles of the "Declaration of Helsinki" and Good Clinical Practice (GCP). Approval from the Independent Ethics Committee/Institutional Review Board (IEC/IRB) was obtained before study start and was documented in a letter to the Investigator specifying the date on which the committee met and granted the approval. The Sponsor also obtained approval from the relevant Competent Authority prior to starting the study.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	17 April 2012
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Brazil: 32
Country: Number of subjects enrolled	United States: 27
Country: Number of subjects enrolled	Spain: 17
Country: Number of subjects enrolled	Denmark: 15
Country: Number of subjects enrolled	France: 41
Country: Number of subjects enrolled	Germany: 44
Country: Number of subjects enrolled	Italy: 37
Worldwide total number of subjects	213
EEA total number of subjects	154

Notes:

Subjects enrolled per age group

In utero	0
----------	---

Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	154
From 65 to 84 years	58
85 years and over	1

Subject disposition

Recruitment

Recruitment details: -

Pre-assignment

Screening details:

Due to non-randomized nature of the study (single infusion cohort started enrollment only after separate infusion cohort recruitment was completed) and different baseline characteristics of participants, the comparison between the 2 cohorts was not performed. Hence, the efficacy and safety results for the 2 cohorts should be considered separately.

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Not applicable
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
------------------------------	-----

Arm title	Pertuzumab + Trastuzumab + Vinorelbine: Separate Infusion
------------------	---

Arm description:

Pertuzumab IV infusion at a loading dose of 840 milligrams (mg) on Day 1 of Cycle 1 (cycle length = 21 days), followed by 420 mg on Day 1 of each subsequent cycle. Trastuzumab IV infusion at a loading dose of 8 mg per kilogram (mg/kg) on Day 2 of Cycle 1, followed by 6 mg/kg on Day 2 of each subsequent cycle. Vinorelbine IV infusion (administered after trastuzumab) at a dose of 25 mg per meter-squared (mg/m²) on Day 2 and Day 9 of Cycle 1, followed by 30-35 mg/m² on Day 2 and Day 9 of each subsequent cycle. Pertuzumab and trastuzumab were administered sequentially in separate infusion bags, followed by vinorelbine until disease progression, unacceptable toxicity, withdrawal of consent, death, or predefined study end (up to 47 cycles).

Arm type	Experimental
Investigational medicinal product name	Pertuzumab
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Concentrate for solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

Loading dose of 840 mg on Day 1 of first 21-day cycle, followed by 420 mg on Day 1 of each subsequent cycle.

Investigational medicinal product name	Trastuzumab
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Powder for concentrate for solution for injection/infusion
Routes of administration	Intravenous use

Dosage and administration details:

Loading dose of 8 mg/kg on Day 1 of first 21-day cycle, followed by 6 mg/kg on Day 1 or 2 of each subsequent cycle.

Investigational medicinal product name	Vinorelbine
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Concentrate for solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

A dose of 25 mg/m² followed by 30-35 mg/m² on Days 2 and 9 of the first 21-day cycle and on Days 1 and 8 (or Days 2 and 9) of each subsequent cycle.

Arm title	Pertuzumab + Trastuzumab + Vinorelbine: Single Infusion
Arm description:	
Pertuzumab IV infusion at a loading dose of 840 mg on Day 1 of Cycle 1 (cycle length = 21 days), followed by 420 mg on Day 1 of each subsequent cycle. Trastuzumab IV infusion at a loading dose of 8 mg/kg on Day 2 of Cycle 1, followed by 6 mg/kg on Day 1 of each subsequent cycle. Vinorelbine IV infusion at a dose of 25 mg/m ² on Day 2 and Day 9 of Cycle 1, followed by 30-35 mg/m ² on Day 1 and Day 8 of each subsequent cycle. If administration of all 3 drugs was well tolerated in Cycle 1, then on Day 1 of each subsequent cycle, pertuzumab 420 mg and trastuzumab 6 mg/kg was administered in a single infusion bag, followed by vinorelbine until disease progression, unacceptable toxicity, withdrawal of consent, death, or predefined study end (up to 47 cycles).	
Arm type	Experimental
Investigational medicinal product name	Pertuzumab
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Concentrate for solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

Subject analysis set title	Intent-to-treat (ITT) population
----------------------------	----------------------------------

Subject analysis set type	Intention-to-treat
---------------------------	--------------------

Subject analysis set description:

ITT population included all participants enrolled into the study was used for all analyses in this study.

Primary: Percentage of Participants With Best Overall Response (BOR) as Assessed by Investigator According to Response Evaluation Criteria in Solid Tumors Version 1.1 (RECIST v1.1)

End point title	Percentage of Participants With Best Overall Response (BOR) as Assessed by Investigator According to Response Evaluation Criteria in Solid Tumors Version 1.1 (RECIST v1.1) ^[1]
-----------------	--

End point description:

Tumor response was assessed by investigator according to RECIST v1.1. BOR was defined as percentage of participants with a confirmed complete response (CR) or partial response (PR). All measurable lesions up to a maximum of 2 lesions per organ and 5 lesions in total or pathological nodes (with short axis [SA] of at least (\geq) 15 millimeter [mm]) were identified as target lesions (TLs) and measured and recorded at baseline. A sum of diameters (longest for non-nodal lesions, SA for nodal lesions) for all TLs was calculated and reported as baseline sum of diameters (SD). All other lesions (or sites of disease) were identified as non-TLs. CR: disappearance of all TLs and SA reduction to less than ($<$) 10 mm for nodal TLs/ non-TLs. PR: \geq 30 percent (%) decrease in SD of TLs, taking as reference baseline SD. Confirmation of response at 2 consecutive tumor assessments \geq 4 weeks apart was required. The 95% confidence interval (CI) was computed using Clopper-Pearson approach. ITT population.

End point type	Primary
----------------	---------

End point timeframe:

Baseline, every 3 cycles up to 36 months, and every 6 cycles thereafter if progression free after 36 months, 28 days after end of treatment, every 3 months thereafter (maximum up to approximately 3.5 years)

Notes:

[1] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: Results were reported descriptively and were not planned to be analyzed for statistically significant differences between groups.

[3] - Only participants with measurable disease at baseline were included in the analysis.

Statistical analyses

No statistical analyses for this end point

Secondary: Time to Response as Assessed by Investigator According to RECIST v 1.1

End point title	Time to Response as Assessed by Investigator According to RECIST v 1.1
-----------------	--

End point description:

For participants with a BOR of CR or PR, time to response = (Date of first confirmed CR/PR - Date of first study treatment) + 1. For participants without a CR or PR, time to response = (Date of adequate last tumor assessment - Date of first study treatment) + 1. For participant with no tumor assessment (or if all assessments were progressive disease [PD]) the censoring day was set to date of first study treatment +1. CR: the disappearance of all TLs and SA reduction to <10 mm for nodal TLs/ non-TLs. PR: $\geq 30\%$ decrease in SD of TLs, taking as reference the baseline SD. Confirmation of response at 2 consecutive tumor assessments ≥ 4 weeks apart was required. PD: $\geq 20\%$ relative increase and ≥ 5 mm of absolute increase in the SD of TLs, taking as reference the smallest SD recorded since treatment started, or appearance of 1 or more new lesions. The 95% CI was computed using log-log transformation. ITT population.

Secondary: Change from Baseline in Functional Assessment of Cancer Therapy-Breast (FACT-B) Questionnaire Score

End point title	Change from Baseline in Functional Assessment of Cancer Therapy-Breast (FACT-B) Questionnaire Score
-----------------	---

End point description:

FACT-B questionnaire is used for assessment of health-related QoL in participants with breast cancer. It consists of 36 items, summarized to 5 subscales: physical (7 items), functional (7 items), social/family (7 items); all 3 ranged from 0 to 28, emotional (6 items) ranging from 0 to 24, and breast cancer subscale (9 items) ranging from 0 to 36; high subscale score represents a better QoL. All single-item measures ranges from 0='Not at all' to 4='Very much'. Total possible score ranged from 0 to 144. High scale score represents a better QoL. ITT population. Here, 'Number of subjects analysed' signifies the number of participants evaluable for this outcome measure and 'n' signifies the number of participants evaluable at specified time point. The data '99999' in the results signifies that either mean was not available because no participant was evaluable or standard deviation was not available because only 1 participant was evaluable at indicated time points.

End point type	Secondary
----------------	-----------

End point timeframe:

Baseline, thereafter every 3 cycles from Cycle 3 to Cycle 45 (each cycle = 21 days)

Adverse events

Adverse events information

Timeframe for reporting adverse events:

Day 1 until 28 days after last study treatment (up to approximately 3.5 years)

Adverse event reporting additional description:

Treatment-emergent adverse events (TEAEs) are adverse events occurring between first dose of study drug and up to 28 days after last dose that were absent before treatment or that worsened relative to pre-treatment state. Safety Population included all participants who received at least one dose of any study treatment in any of the 2 cohorts.

Assessment type	Non-systematic

Reporting groups

Reporting group title	Pertuzumab + Trastuzumab + Vinorelbine: Separate Infusion
-----------------------	---

Reporting group description:

Pertuzumab IV infusion at a loading dose of 840 mg on Day 1 of Cycle 1 (cycle length = 21 days), followed by 420 mg on Day 1 of each subsequent cycle. Trastuzumab IV infusion at a loading dose of 8 mg/kg on Day 2 of Cycle 1, followed by 6 mg/kg on Day 2 of each subsequent cycle. Vinorelbine IV infusion (administered after trastuzumab) at a dose of 25 mg/m² on Day 2 and Day 9 of Cycle 1, followed by 30-35 mg/m² on Day 2 and Day 9 of each subsequent cycle. Pertuzumab and trastuzumab were administered sequentially in separate infusion bags, followed by vinorelbine until disease progression, unacceptable toxicity, withdrawal of consent, death, or predefined study end (up to 47 cycles).

Reporting group title	Pertuzumab + Trastuzumab + Vinorelbine: Single Infusion
-----------------------	---

Reporting group description:

Pertuzumab IV infusion at a loading dose of 840 mg on Day 1 of Cycle 1 (cycle length = 21 days), followed by 420 mg on Day 1 of each subsequent cycle. Trastuzumab IV infusion at a loading dose of 8 mg/kg on Day 2 of Cycle 1, followed by 6 mg/kg on Day 1 of each subsequent cycle. Vinorelbine IV infusion at a dose of 25 mg/m² on Day 2 and Day 9 of Cycle 1, followed by 30-35 mg/m² on Day 1 and Day 8 of each subsequent cycle. If administration of all 3 drugs was well tolerated in Cycle 1, then on Day 1 of each subsequent cycle, pertuzumab 420 mg and trastuzumab 6 mg/kg was administered in a single infusion bag, followed by vinorelbine until disease progression, unacceptable toxicity, withdrawal of consent, death, or predefined study end (up to 47 cycles).

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
05 March 2012	<ul style="list-style-type: none">- As MO27782 was an open-label study, words referring to randomization were removed and/or replaced- The study treatment administration scheme was corrected- The algorithm for continuation and discontinuation of pertuzumab and trastuzumab based on left ventricular ejection fraction (LVEF) assessments were revised in order to be consistent with the baseline LVEF criteria of $\geq 55\%$- Clarification of several exclusion criteria- Clarification of the role of the IDMC- Changes to the prior and concomitant medications and therapies- Change to the time of the final analysis of primary endpoint
23 January 2013	<ul style="list-style-type: none">- Clarification of the timing of the IDMC review- Inclusion of participants who had received hormonal therapy. To reflect the current use of hormonal therapies and everolimus in the participant population, the protocol was amended to allow inclusion of participants who, prior to study entry had received up to two lines of hormonal therapies for metastatic or locally recurrent disease, one of which could have been in combination with everolimus- Inclusion of participants with central nervous system (CNS) metastases, if the CNS metastases were medically well controlled prior to screening (as assessed by the investigator) after receiving local therapy (irradiation, surgery, etc) but without anti-Human Epidermal Growth Factor Receptor (HER) 2 therapy- Clarification of several exclusion criteria (including the exclusion of participants with cardiac disorders at risk of a serious adverse event)- Endpoint assessment and study end. Modification to timing of final assessment of ORR to enable timely results, rather than an open-ended final assessment time. Clarification of OS analysis timing and end of study- Infusion times and scheduling. New instructions introduced to enable appropriate monitoring of safety during initial pertuzumab/trastuzumab infusions- Abnormal liver values. New section introduced providing guidance on abnormal liver values, as required by updated Roche protocol template- Clarification of coagulation testing and HER2 status assessments
20 January 2014	<ul style="list-style-type: none">- Removal of the use of the Independent Review Committee to assess the primary endpoint. Amended to "the primary endpoint to include ORR as assessed by the Investigator"- Analysis sections updated to ensure an accurate description of data evaluation. Efficacy endpoints were to be presented by each cohort with an exploratory comparison between cohorts only- Pregnancy follow-up. Increased pregnancy follow-up, restrictions on breastfeeding and use of adequate contraception to 7 months following last dose of study medication, in line with changes to recommendations given in trastuzumab labeling- Scope of interim review. Defined to reflect that efficacy data were to have been provided if requested by the IDMC, as outlined in the IDMC charter- Definition of secondary variables (time to response, duration of response, PFS, time to progression and overall survival) were amended to be measured as time from first intake of study medication rather than time from date of enrollment as this provided a more accurate measure of these endpoints. Documentation of PFS was broadened to include the option of pathological diagnosis of progression

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
