

Clinical trial results:

HZA106853: A dose-ranging study of vilanterol (VI) inhalation powder in children aged 5-11 years with asthma on a background of inhaled corticosteroid therapy.

Summary

EudraCT number	2011-003337-34
Trial protocol	DE Outside EU/EEA PL SK
Global end of trial date	28 April 2014

Results information

Result version number	v1 (current)

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	Yes
EMA paediatric investigation plan number(s)	EMA-000431-PIP01-08
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	11 September 2014
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	28 April 2014
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary objective is to evaluate the dose response, efficacy and safety of three doses of VI inhalation powder administered once daily in the evening in children aged 5-11 years with persistent uncontrolled asthma over a 4 week treatment period.

Protection of trial subjects:

The following steps were taken to protect trial participants:

- 1). Only participants meeting all of the inclusion criteria and none of the exclusion criteria were randomized to investigational medication.
- 2). All participants enrolled into the study were provided rescue medication for use as necessary.
- 3). Subject lung function, as measured by morning (AM) and evening (PM) peak expiratory flow (PEF), was monitored for stability through the use of a daily electronic diary.
- 4). The investigator or treating physician could have unblinded a participant's treatment assignment in the case of an emergency, when knowledge of the study treatment was essential for the appropriate clinical management or welfare of the participant.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	27 March 2012
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Adults (18-64 years)	0
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

1208 participants (par.) were screened; 760 were enrolled/entered the Run-in Phase, 463 were randomized, and 2 received study medication (SM) but weren't randomized/included in the Intent-to-Treat (ITT) Population (randomized to treatment and receiving ≥ 1 SM dose). 7 randomized par. didn't receive SM; hence, 456 par. comprised the ITT Population.

Pre-assignment

Screening details:

Participants who met the eligibility criteria at screening (Visit 1) entered the Run-in Phase for completion of Baseline safety evaluations and measures of asthma status. Participants meeting all randomization criteria at Visit 3 were randomized to 1 of 4 treatment arms. The total duration of study participation was up to a maximum of 9 weeks.

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Monitor, Data analyst, Carer, Assessor

Arms

Are arms mutually exclusive?	Yes
Arm title	Placebo

Arm description:

Participants received placebo once daily (OD) in the evening from a dry powder inhaler for 4 weeks in addition to open-label fluticasone propionate (FP) 100 micrograms (μg) twice daily (BID). Participants were provided albuterol/salbutamol inhalation aerosol to be used as rescue medication.

Arm type	Placebo
Investigational medicinal product name	Placebo

Primary: Change from Baseline in daily pre-dose evening (PM) peak expiratory flow (PEF) from participant electronic daily diary averaged over the 4-week Treatment Period

End point title	Change from Baseline in daily pre-dose evening (PM) peak expiratory flow (PEF) from participant electronic daily diary averaged over the 4-week Treatment Period
End point description: PEF is defined as the maximum airflow during a forced expiration beginning with the lungs fully inflated. PEF was measured by the participants using a hand-held electronic peak flow meter each evening prior to the dose of study medication and any rescue albuterol/salbutamol inhalation aerosol use each morning. The best of three measurements was recorded. Change from Baseline was calculated as the value of the averaged daily PM PEF over the 4-week Treatment Period minus the Baseline value. The Baseline PEF value is defined as the average of the last 7 days of the Run-in Phase. The analysis was performed using an analysis of covariance (ANCOVA) model with covariates of Baseline, region, sex, age, and treatment. Only those participants contributing data per the daily eDiary were analyzed.	
End point type	Primary

Secondary: Change from Baseline in evening clinic visit trough (pre-bronchodilator and pre-dose) forced expiratory volume in one second (FEV1) at the end of the 4-week Treatment Period in children who could perform the maneuver

End point title	Change from Baseline in evening clinic visit trough (pre-bronchodilator and pre-dose) forced expiratory volume in one second (FEV1) at the end of the 4-week Treatment Period in children who could perform the maneuver
-----------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

End point description:

Pulmonary function was measured by FEV1, defined as the maximal amount of air that can be forcefully exhaled in one second. Trough FEV1 is defined as a pre-dose FEV1 measurement taken at a clinic visit while still on treatment. Change from Baseline in trough FEV1 at the end of the 4-week Treatment Period was defined using the pre-dose FEV1 measurement taken at the Week 4 clinic visit. Change from Baseline was calculated as the Week 4 trough FEV1 value minus the Baseline value. The Baseline FEV1 value is defined as the value at Visit 3 (randomization). The analysis was performed using an ANCOVA model with covariates of Baseline trough FEV1, region, sex, age, and treatment. The last observation carried forward (LOCF) method was used to impute missing data, in which the last non-missing post-Baseline on-treatment measurement at scheduled clinic visits was used to impute the missing measurements.

Secondary: Change from Baseline in the percentage of rescue-free 24-hour periods during the 4-week Treatment Period

End point title	Change from Baseline in the percentage of rescue-free 24-hour periods during the 4-week Treatment Period
-----------------	----------------------------------------------------------------------------------------------------------

End point description:

The number of inhalations of rescue albuterol/salbutamol inhalation aerosol (medication used to relieve symptoms immediately) used during the day and night) was recorded by the participants in a daily diary. A 24-hour period in which a participant's responses to both the morning and evening assessments indicated no use of rescue medication was considered as rescue free. Participants who were rescue free for 24-hour periods during the 4-week Treatment Period were assessed. The Baseline value was derived from the last 7 days of the daily diary prior to the randomization of the participant. Change from Baseline is calculated as the average value during the 4-week Treatment Period minus the value at Baseline. The Baseline value is defined as the value at Visit 3 (randomization). Analysis was performed using ANCOVA with covariates of Baseline, region, sex, age, and treatment.

Secondary: Change from Baseline in AM PEF over the last 7 days of the Treatment Period (Week 4)

End point title	Change from Baseline in AM PEF over the last 7 days of the Treatment Period (Week 4)
-----------------	--------------------------------------------------------------------------------------

End point description:

PEF is defined as the maximum airflow during a forced expiration beginning with the lungs fully inflated. PEF was measured by the participants using a hand-held electronic peak flow meter each morning prior to the dose of study medication and any rescue albuterol/salbutamol inhalation aerosol use. Change

from Baseline is calculated as the value of the averaged daily AM PEF over the 4-week Treatment Period (at Week 4) minus the Baseline value. The Baseline value is defined as the value at Visit 3 (randomization). The analysis was performed using an ANCOVA model with covariates of Baseline, region, sex, age, and treatment group.

End point type	Secondary
End point timeframe:	
Baseline; Week 4

Secondary: Change from Baseline in the percentage of symptom-free 24-hour periods during the 4-week Treatment Period

End point title	Change from Baseline in the percentage of symptom-free 24-hour periods during the 4-week Treatment Period
End point description:	
Asthma symptoms were recorded in a daily eDairy by the participants every day in the morning and evening before taking any rescue or study medication and before the PEF measurement. A 24-hour (hr) period in which a participant's responses to both the morning and evening assessments indicated no symptoms was considered to be symptom free. The Baseline symptom-free value is defined as the value at Visit 3 (randomization). Change from Baseline was calculated as the averaged value during the 4-week Treatment Period minus the Baseline value. The analysis was performed using an ANCOVA model with covariates of Baseline, region, sex, age, and treatment group.

Adverse events

Adverse events information

Timeframe for reporting adverse events:

On-treatment serious adverse events (SAEs) and non-serious adverse events (AEs) were collected from the start of study medication until the follow-up visit (up to 9 weeks).

Adverse event reporting additional description:

On-treatment SAEs and non-serious AEs are reported for members of the ITT Population, comprised of all participants who were randomized to treatment and received at least one dose of study medication.

Assessment type	Systematic

Reporting groups

Reporting group title	Placebo
-----------------------	---------

Reporting group description:

Participants received placebo once daily (OD) in the evening from a dry powder inhaler for 4 weeks in addition to open-label fluticasone propionate (FP) 100 micrograms (µg) twice daily (BID). Participants were provided albuterol/salbutamol inhalation aerosol to be used as rescue medication.

Reporting group title	VI 6.25 OD
-----------------------	------------

Reporting group description:

Participants received vilanterol (VI) 6.25 µg OD in the evening from a dry powder inhaler for 4 weeks in addition to open-label FP 100 µg BID. Participants were provided albuterol/salbutamol inhalation aerosol to be used as rescue medication.

Reporting group title	VI 12.5 OD
-----------------------	------------

Reporting group description:

Participants received VI 12.5 µg OD in the evening from a dry powder inhaler for 4 weeks in addition to open-label FP 100 µg BID. Participants were provided albuterol/salbutamol inhalation aerosol to be used as rescue medication.

Reporting group title	VI 25 OD
-----------------------	----------

Reporting group description:

Participants received VI 25 µg OD in the evening from a dry powder inhaler for 4 weeks in addition to open-label FP 100 µg BID. Participants were provided albuterol/salbutamol inhalation aerosol to be used as rescue medication.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
05 June 2012	This amendment was implemented to remove the requirement that participants must achieve a reversibility of 12% at Visit 1. This amendment also includes changes to the inhaled corticosteroid (ICS) doses allowed prior to Visit 1 and addresses the re-screening of participants found to be ineligible prior to this amendment. Additional edits were made to the statistical sections to the effect that the primary analysis will be the pairwise comparison of each dose regimen of vilanterol with placebo.
14 December 2012	The purpose of this amendment was to allow for the re-screening of participants who failed Visit 1 criteria. Additional edits were made to the statistical sections to the effect that the primary analysis will be the comparison of each dose regimen of vilanterol with placebo.
19 September 2013	The purpose of this amendment was to implement a change to the time point for the primary endpoint (from an endpoint assessment to the average over the treatment period) and to the analysis for the primary endpoint.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
