Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	Yes
EMA paediatric investigation plan number(s)	EMA-000431-PIP01-08
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	14 January 2015
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	24 September 2014
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary objective of this study is to evaluate the dose response, efficacy and safety of three doses of fluticasone furoate (FF) inhalation powder administered once daily in the evening to children aged 5-11 years with persistent uncontrolled asthma over a 12 week treatment period.

Protection of trial subjects:

The following steps were taken to protect trial participants:

- 1). Only participants meeting all of the inclusion criteria and none of the exclusion criteria were randomized to investigational medication.
- 2). All participants enrolled into the study were provided rescue medication for use as necessary.
- 3). Subject lung function, as measured by morning (AM) and evening (PM) peak expiratory flow (PEF), was monitored for stability through the use of a daily electronic diary.
- 4). The investigator or treating physician could have unblinded a participant's treatment assignment in the case of an emergency, when knowledge of the study treatment was essential for the appropriate clinical management or welfare of the participant.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	27 March 2012
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	1540
Adolescents (12-17 years)	0
Adults (18-64 years)	0
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

1540 participants were screened, 596 participants were randomized, and 593 participants comprise the Intent to Treat Population which include all participants who received at least one dose of study treatment. Participants were stratified at randomization according to their prior inhaled corticosteroid (ICS) use.

Pre-assignment

Screening details:

Participants who met the eligibility criteria at screening (Visit 1) entered a 4-week Run-in Period during which they continued their existing medications. Participants who met the randomization criteria (remained uncontrolled despite baseline therapy) at Visit 3 were randomized to 1 of 5 treatment arms for 12 weeks followed by a 1-week follow-up.

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Monitor, Data analyst, Carer, Assessor

Arms

Are arms mutually exclusive?	Yes
Arm title	Placebo

Arm description:

Participants received placebo once daily (OD) in the evening via a dry powder inhaler (DPI) and placebo twice daily (BID), once in the morning and once in the evening via a separate DPI for 12 weeks. Participants were also provided albuterol/salbutamol inhalation aerosol via metered dose inhaler (MDI) to be used as rescue medication as determined by the investigator.

Arm type	Placebo
Investigational medicinal product name	placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Inhalation powder
Routes of administration	Inhalation use

Dosage and administration details:

Participants received placebo once daily (OD) in the evening via a dry powder inhaler (DPI) and placebo twice daily (BID), once in the morning and once in the evening via a separate DPI for 12 weeks. Participants were also provided albuterol/salbutamol inhalation aerosol via metered dose inhaler (MDI) to be used as rescue medication as determined by the investigator.

Arm title	FF 25 µg OD
------------------	-------------

Arm description:

Participants received fluticasone furoate (FF) 25 micrograms (µg) OD in the evening via a DPI and placebo BID, once in the morning and once in the evening via a separate DPI for 12 weeks. Participants were also provided albuterol/salbutamol inhalation aerosol via metered dose inhaler (MDI) to be used as rescue medication as determined by the investigator.

Arm type	Experimental
Investigational medicinal product name	fluticasone furoate
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Inhalation powder
Routes of administration	Inhalation use

Dosage and administration details:

25 µg (micrograms) once daily via a dry powder inhaler

Arm title	FF 50 µg OD
Arm description: Participants received FF 50 µg OD in the evening via a DPI and placebo BID, once in the morning and once in the evening via a separate DPI for 12 weeks. Participants were also provided albuterol/salbutamol inhalation aerosol via metered dose inhaler (MDI) to be used as rescue medication as determined by the investigator.	
Arm type	Experimental
Investigational medicinal product name	fluticasone furoate
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Inhalation powder
Routes of administration	Inhalation use

Dosage and administration details:

50 µg once daily via a dry powder inhaler

Arm title	FF 100 µg OD
Arm description: Participants received FF 100 µg OD in the evening via a DPI and placebo BID, once in the morning and once in the evening via a separate DPI for 12 weeks. Participants were also provided albuterol/salbutamol inhalation aerosol via metered dose inhaler (MDI) to be used as rescue medication as determined by the investigator.	
Arm type	Experimental
Investigational medicinal product name	fluticasone furoate
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Inhalation powder
Routes of administration	Inhalation use

Dosage and administration details:

100 µg once daily via a dry powder inhaler

Arm title	FP 100 µg BID
Arm description: Participants received fluticasone propionate (FP) 100 µg BID, once in the morning and once in the evening via a DPI and placebo OD in the evening via a separate DPI for 12 weeks. Participants were also provided albuterol/salbutamol inhalation aerosol via metered dose inhaler (MDI) to be used as rescue medication as determined by the investigator.	
Arm type	Active comparator
Investigational medicinal product name	fluticasone propionate
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Inhalation powder
Routes of administration	Inhalation use

Dosage and administration details:

100 µg twice daily via a dry powder inhaler

Lost to follow-up	1	1
Lack of efficacy	21	19
Protocol deviation	1	3

Notes:

[1] - The number of subjects reported to be in the baseline period are not the same as the worldwide number enrolled in the trial. It is expected that these numbers will be the same.

Justification: 1540 participants were enrolled and screened, 596 participants were randomized, and 593 participants comprise the Intent to Treat which include all participants who received at least one dose of study treatment and is outlined in the baseline period.

Baseline characteristics

Reporting groups

Reporting group title	Placebo
Reporting group description: Participants received placebo once daily (OD) in the evening via a dry powder inhaler (DPI) and placebo twice daily (BID), once in the morning and once in the evening via a separate DPI for 12 weeks. Participants were also provided albuterol/salbutamol inhalation aerosol via metered dose inhaler (MDI) to be used as rescue medication as determined by the investigator.	
Reporting group title	FF 25 µg OD
Reporting group description: Participants received fluticasone furoate (FF) 25 micrograms (µg) OD in the evening via a DPI and placebo BID, once in the morning and once in the evening via a separate DPI for 12 weeks. Participants were also provided albuterol/salbutamol inhalation aerosol via metered dose inhaler (MDI) to be used as rescue medication as determined by the investigator.	
Reporting group title	FF 50 µg OD
Reporting group description: Participants received FF 50 µg OD in the evening via a DPI and placebo BID, once in the morning and once in the evening via a separate DPI for 12 weeks. Participants were also provided albuterol/salbutamol inhalation aerosol via metered dose inhaler (MDI) to be used as rescue medication as determined by the investigator.	
Reporting group title	FF 100 µg OD
Reporting group description: Participants received FF 100 µg OD in the evening via a DPI and placebo BID, once in the morning and once in the evening via a separate DPI for 12 weeks. Participants were also provided albuterol/salbutamol inhalation aerosol via metered dose inhaler (MDI) to be used as rescue medication as determined by the investigator.	
Reporting group title	FP 100 µg BID
Reporting group description: Participants received fluticasone propionate (FP) 100 µg BID, once in the morning and once in the evening via a DPI and placebo OD in the evening via a separate DPI for 12 weeks. Participants were also provided albuterol/salbutamol inhalation aerosol via metered dose inhaler (MDI) to be used as rescue medication as determined by the investigator.

Participants were also provided albuterol/salbutamol inhalation aerosol via metered dose inhaler (MDI) to be used as rescue medication as determined by the investigator.	

Primary: Change from Baseline in daily pre-dose morning (AM) peak expiratory flow (PEF) from participant electronic daily diary averaged over the 12-week Treatment Period

End point title	Change from Baseline in daily pre-dose morning (AM) peak expiratory flow (PEF) from participant electronic daily diary averaged over the 12-week Treatment Period
-----------------	---

End point description:

PEF is defined as the maximum airflow during a forced expiration beginning with the lungs fully inflated. PEF was measured by the participants using a hand-held electronic peak flow meter each morning prior to the dose of study medication and any rescue albuterol/salbutamol inhalation aerosol use. The best of three measurements was recorded. Change from Baseline was calculated as the value of the averaged daily AM PEF over the 12-week Treatment Period minus the Baseline value. The Baseline PEF value is

defined as the average of the last 7 days of the Run-in Period. Statistical analysis was performed using an analysis of covariance (ANCOVA) model with covariates of Baseline AM PEF, pre-screening inhaled corticosteroid (ICS) use, region, sex, age, and treatment. Participants analyzed included those who have PEF data for at least 2 non-missing days in the Baseline week prior to randomisation and at least 2 non-missing days after randomisation.

Secondary: Change from Baseline in evening clinic visit trough (pre-bronchodilator and pre-dose) forced expiratory volume in one second (FEV1) at the end of the 12-week Treatment Period in children who could perform the maneuver

End point title	Change from Baseline in evening clinic visit trough (pre-bronchodilator and pre-dose) forced expiratory volume in one second (FEV1) at the end of the 12-week Treatment Period in children who could perform the maneuver
-----------------	---

End point description:

Pulmonary function was measured by FEV1, defined as the maximal amount of air that can be forcefully exhaled in one second. Trough FEV1 is defined as a pre-dose FEV1 measurement taken at a clinic visit while still on treatment. Change from Baseline was calculated as the Week 12 trough FEV1 value minus the Baseline value. The Baseline FEV1 value is defined as the value at Visit 3 (randomization). The analysis was performed using an ANCOVA model with covariates of Baseline trough FEV1, region, actual pre-screening ICS use, sex, age, and treatment. The last observation carried forward (LOCF) method was used to impute missing data, in which the last non-missing post-Baseline on-treatment measurement at scheduled clinic visits was used to impute the missing measurements. Only those participants available at the specified time points were analyzed.

Secondary: Change from Baseline in the percentage of rescue-free 24-hour periods

during the 12-week Treatment Period

End point title	Change from Baseline in the percentage of rescue-free 24-hour periods during the 12-week Treatment Period
-----------------	---

End point description:

The number of inhalations of rescue albuterol/salbutamol aerosol (medication used to relieve symptoms immediately) used during the day and night) was recorded by the participants in a daily diary. A 24-hour (hr) period in which a participant's responses to both the morning and evening assessments indicated no use of rescue medication was considered as rescue free. Participants who were rescue free for 24-hour periods during the 12-week Treatment Period were assessed. The Baseline value was derived from the last 7 days of the daily diary prior to the randomization of the participant. Change from Baseline was calculated as the average value during the 12-week Treatment Period minus the value at Baseline. Analysis was performed using ANCOVA with covariates of Baseline, region, sex, actual pre-screening ICS use, age, and treatment.

Secondary: Change from Baseline in daily evening (PM) PEF averaged over the 12-week Treatment Period

End point title	Change from Baseline in daily evening (PM) PEF averaged over the 12-week Treatment Period
-----------------	---

End point description:

PEF is defined as the maximum airflow during a forced expiration beginning with the lungs fully inflated. PEF was measured by the participants using a hand-held electronic peak flow meter each evening prior to the dose of study medication and any rescue albuterol/salbutamol inhalation aerosol use. Change from Baseline was calculated as the value of the averaged daily PM PEF over the 12-week Treatment Period (at Week 12) minus the Baseline value. The Baseline PEF value is defined as the average of the last 7 days of the Run-in Period. Statistical analysis was performed using ANCOVA model with covariates of Baseline, pre-screening ICS use, region, sex, age, and treatment. Participants analyzed included those who have PEF data for at least 2 non-missing days in the Baseline week prior to randomisation and at least 2 non-missing days after randomisation.

Secondary: Change from Baseline in the percentage of symptom-free 24-hour periods during the 12-week Treatment Period

End point title	Change from Baseline in the percentage of symptom-free 24-hour periods during the 12-week Treatment Period
-----------------	--

End point description:

Asthma symptoms were recorded in a daily eDairy by the participants every day in the morning and evening before taking any rescue or study medication and before the PEF measurement. A 24-hour (hr) period in which a participant's responses to both the morning and evening assessments indicated no symptoms was considered to be symptom free. The Baseline symptom-free value is defined as the value at Visit 3 (randomization). Change from Baseline was calculated as the averaged value during the 12-week Treatment Period minus the Baseline value. The analysis was performed using an ANCOVA model with covariates of Baseline, region, sex, actual pre-screening ICS use, age, and treatment group.

Adverse events

Adverse events information

Timeframe for reporting adverse events:

On-treatment serious adverse events (SAEs) and non-serious adverse events (AEs) were collected from the start of study medication until the follow-up visit (up to 13 weeks).

Adverse event reporting additional description:

On-treatment SAEs and non-serious AEs are reported for members of the ITT Population, comprised of all participants who were randomized to treatment and received at least one dose of study medication.

Assessment type	Systematic

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
29 February 2012	The purpose of this amendment is to specify that Japan will not conduct the Paediatric Asthma Quality of Life (PAQLQ) measure on children enrolled in this protocol.
05 July 2012	The purpose of this amendment is to make changes to the ICS doses allowed prior to Visit 1. Additional edits were made to the statistical sections to the effect that the primary analysis will be the comparison of each dose regimen of fluticasone furoate with placebo.
14 December 2012	The purpose of this amendment is to revise the dose for Clenil and Qvar used prior to Visit 1 and to allow for the re-screening of subjects who failed Visit 1 criteria.
19 September 2013	The purpose of this amendment is to implement a change to the time of the primary endpoint, daily PEF, from evening to morning assessments. Additional edits were made to the time point for the primary endpoint (from an endpoint assessment to the average over the treatment period) and to the statistical analysis of the primary endpoint including multiplicity adjustment methods.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
