Notes:

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	Yes
EMA paediatric investigation plan number(s)	EMEA-001331-PIP01-12
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	Yes

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	16 April 2018
Is this the analysis of the primary completion data?	No

Global end of trial reached?	Yes
Global end of trial date	28 December 2017
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary objective of this study is to evaluate the safety and efficacy of sebelipase alfa in a broad population of participants with lysosomal acid lipase deficiency.

Protection of trial subjects:

This study was conducted in accordance with International Conference on Harmonisation (ICH) Good Clinical Practice, and the principles of the Declaration of Helsinki, in addition to following the laws and regulations of the country or countries in which a study is conducted.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	24 June 2014
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Australia: 1
Country: Number of subjects enrolled	Netherlands: 1
Country: Number of subjects enrolled	Spain: 8
Country: Number of subjects enrolled	Croatia: 2
Country: Number of subjects enrolled	Belgium: 4
Country: Number of subjects enrolled	Denmark: 1
Country: Number of subjects enrolled	Germany: 1
Country: Number of subjects enrolled	Italy: 1
Country: Number of subjects enrolled	Brazil: 2
Country: Number of subjects enrolled	Canada: 1
Country: Number of subjects enrolled	Mexico: 4
Country: Number of subjects enrolled	Russian Federation: 1
Country: Number of subjects enrolled	Turkey: 1
Country: Number of subjects enrolled	United States: 3
Worldwide total number of subjects	31
EEA total number of subjects	18

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	16
Adolescents (12-17 years)	6
Adults (18-64 years)	9
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

A total of 21 study centers were initiated in 15 countries, including Australia, Belgium, Brazil, Canada, Croatia, Denmark, Germany, Italy, Mexico, Netherlands, Russia, Spain, Turkey, United Kingdom (UK), and the United States. Seventeen study centers screened at least 1 participant in all of these countries, except the UK and the Netherlands.

Pre-assignment

Screening details:

The study consisted of a screening period of up to 45 days. The maximum duration of a participant's participation in the study, inclusive of screening and follow-up visits, was approximately 155 weeks.

Period 1

Period 1 title	Overall Trial (overall period)
Is this the baseline period?	Yes
Allocation method	Non-randomised - controlled
Blinding used	Not blinded

Blinding implementation details:

None (Open Label)

Arms

Arm title	Sebelipase Alfa

Arm description:

Participants initiated intravenous (IV) treatment with sebelipase alfa at a dose of 1 milligram (mg)/kilogram (kg) every other week (qow). Dose escalation to 3 mg/kg qow was considered if the participant met pre-defined dose-escalation criteria. A subsequent dose escalation to 3 mg/kg every week (qw) was considered if the participant continued to meet these criteria when receiving a dose of 3 mg/kg qow.

Arm type	Experimental
Investigational medicinal product name	Sebelipase Alfa
Investigational medicinal product code	
Other name	SBC-102
Pharmaceutical forms	Concentrate for solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

All eligible participants received repeat IV infusions of sebelipase alfa at an initial dose of 1 mg/kg qow. Sequential dose escalation to 3 mg/kg qow and 3 mg/kg qw was permitted based on evidence of disease progression. Dose decreases were permitted in the event of poor tolerability or in participants who achieved clinical stability on a dose of 3 mg/kg qw. Consecutive infusions were to be administered at least 7 days apart (for qow dosing) and at least 5 days apart (qw dosing).

Number of subjects in period 1	Sebelipase Alfa
Started	31
Completed	25
Not completed	6
Consent withdrawn by subject	2
Pregnancy	2
Liver transplant	1

Progressive disease	1

Baseline characteristics

Subject analysis set title	Pediatric Participants
Subject analysis set type	Sub-group analysis
Subject analysis set description:	
This sub-group is part of the full analysis set and includes only those participants 18 years old or younger.	

Primary: Participants Experiencing Severe Treatment-emergent Adverse Events (TEAEs)

End point title	Participants Experiencing Severe Treatment-emergent Adverse Events (TEAEs)[1]
End point description:	
The number of participants experiencing severe TEAEs is presented for each age group who received sebelipase alfa in this open-label study. Information on adverse events (AEs) was obtained at each scheduled contact with the participant (or participant's parent or legal guardian), by specific questioning and, as appropriate, by examination. An AE was defined as any untoward medical occurrence in a participant that did not necessarily have to have a causal relationship with the administration of the study drug. An AE therefore could have been any unfavorable and unintended sign, symptom or disease temporally associated with the use of the study drug, whether or not considered related to the medicinal product. Pre-existing conditions that worsened in severity during the course of the study were reported as AEs. AEs were recorded from the date of informed consent until completion of the follow-up phone call at 4 weeks after the last infusion of sebelipase alfa administered.	
End point type	Primary
End point timeframe:	
Week 144	

Notes:

[1] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.
Justification: Quantitative statistical analyses were not conducted on any of the reported safety data.

End point values	2-<4 Years	4-18 Years	>18 Years

Secondary: Percent Change In Serum Lipids From Baseline To Week 144

End point title	Percent Change In Serum Lipids From Baseline To Week 144

End point description:

The effect of sebelipase alfa on lipid metabolism was evaluated by measuring the change from baseline to Week 144 in 4 serum lipids: low-density lipoprotein cholesterol (LDL-C); high-density lipoprotein cholesterol (HDL-C); non-HDL-C; triglycerides. Blood samples for these clinical laboratory tests were collected at scheduled time points and analyzed by a central laboratory.

End point type	Secondary

End point timeframe:

Secondary: Participants Testing Positive For Anti-drug Antibodies (ADAs)

End point title	Participants Testing Positive For Anti-drug Antibodies (ADAs)

End point description:

The impact of ADAs on the safety and immunogenicity of sebelipase alfa was evaluated by testing for ADAs in participants who received sebelipase alfa in this open-label study. Blood samples for assessment were collected prior to study infusions at Week 2, Week 4, Week 8, Week 12, and every 12 weeks thereafter. Participants testing positive for ADAs were also tested for the presence of neutralizing antibodies that inhibited sebelipase alfa enzyme activity and/or cellular uptake. Any participant experiencing a moderate or severe infusion-associated reaction (IAR) was to have an additional assessment of ADAs at the next study visit (prior to study drug infusion); these participants were to also have serum samples collected at 1 to 2 hours after IAR onset and at the next study visit (prior to study drug infusion) for analysis of serum tryptase. The number of participants who became ADA positive and who tested positive for neutralizing antibodies are presented.

End point type	Secondary

End point timeframe:

Week 144

Secondary: Percent Change In Body Mass Index (BMI)-For-Age Percentile From Baseline To Week 144 in Pediatric Participants

End point title	Percent Change In Body Mass Index (BMI)-For-Age Percentile From Baseline To Week 144 in Pediatric Participants

End point description:

To evaluate the effects of sebelipase alfa on growth parameters in pediatric participants (≤18 years old) presenting with evidence of growth delay, the percent change in the anthropometric parameter of BMI-for-age percentile from Baseline to Week 144 is reported. Anthropometric parameters were plotted on standard growth curves. When possible, historical data on growth parameters was also incorporated into the analyses. Percentiles and Z-scores for BMI-for-age were determined using standard growth charts appropriate to a participant's age on the date of the assessment: the World Health Organization standard growth chart for participants ≤2 years of age and the Centers for Disease Control standard growth chart for participants >2 years of age.

End point type	Secondary

End point timeframe:

Baseline, Week 144

End point values	Pediatric Participants			
Subject group type	Subject analysis set			
Number of subjects analysed	17[6]			
Units: Percent Change				
arithmetic mean (standard deviation)	26.45 (± 118.432)			

Notes:

[6] - Pediatric Participants (≤18 years old)

Statistical analyses

No statistical analyses for this end point

Secondary: Percent Change In Child-Pugh Status From Baseline To Week 144

End point title	Percent Change In Child-Pugh Status From Baseline To Week 144

End point description:

In order to evaluate the effects of sebelipase alfa on liver function, the change in Child-Pugh status from Baseline to Week 144 for participants with Child-Pugh class C or B at Baseline is reported. The Child-Pugh score is used in clinical practice to assess prognosis in individuals with chronic liver disease. Laboratory data were used in derivation of the score by summing individual scores from clinical laboratory test results and physical examinations, including total serum bilirubin, serum albumin, prothrombin time, ascites, and hepatic encephalopathy. The total score was used to determine the Child-Pugh classification, which was reported as Class A (score of 5 or 6), Class B (score of 7 to 9) or Class C (score of 10 to 15). Higher scores and higher categories represented a worse outcome. Data is reported for the 18 participants with follow-up data at Week 144.

End point type	Secondary

End point timeframe:

Baseline, Week 144

End point values	Sebelipase Alfa			
Subject group type	Reporting group			
Number of subjects analysed	18[7]

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
02 February 2015	– Removed 'seroconversion rate' and 'time to seroconversion' from the immunogenicity outcome variables. The intent was to characterize ADAs for all isotypes. In this study, a participant was considered to be ADA positive if they had at least 1 positive ADA titer at any time during the study. However, a single positive ADA result would not necessarily imply that a participant had seroconverted. Moreover, analysis of tolerization (for which no standard definition exists) would not be appropriate to these circumstances. – Limited liver biopsy by the transjugular method to participants with advanced liver disease (as local facilities permitted), rather than recommending this for all study participants. – Updated the guidance on the management of IARs based on clinical experience in other ongoing studies with sebelipase alfa. – Clarified that AEs collected during hospitalization would be assessed and reported. – Clarified that AEs occurring after signing the informed consent but before the first dose of study drug would only be recorded if deemed related to study procedures or requirements.
07 December 2015	- Clarified that the minimum duration of treatment would be "at least 52 weeks." This clarification was added in response to Pediatric Committee comments on the paediatric investigation plan RfM. - Added a PK profile for participants receiving a dose decrease (the protocol already required a PK profile for participants receiving a dose increase), and added an ADA assessment prior to the first infusion at the new dose for all participants receiving a dose modification (increase or decrease). These additional data will support an evaluation of the relationship between immunogenicity, sebelipase alfa exposure, and clinical response during long-term treatment with sebelipase alfa.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
