Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	Yes
EMA paediatric investigation plan number(s)	EMA-000916-PIP01-10
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	14 April 2014
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	04 March 2014
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary objective was to investigate the effects of a single subcutaneous lixisenatide dose of 5 microgram (mcg) and 10 mcg as compared to placebo in reducing postprandial plasma glucose (PPG) assessed as area under the plasma glucose concentration curve after a standardized liquid meal (breakfast) in type 2 diabetic paediatric population (10 to 17 years old) and adults as controls.

Protection of trial subjects:

Paediatric Subjects:

The study was conducted by investigators experienced in the treatment of paediatric subjects. The parent(s) or guardian(s) as well as the children were fully informed of all pertinent aspects of the clinical trial as well as the possibility to discontinue at any time. In addition to the consent form for the parent(s)/guardian(s), an assent form in child-appropriate language was provided and explained to the child. Repeated invasive procedures were minimized. The number of blood samples as well as the amount of blood drawn were adjusted according to age and weight. A topical anaesthesia may have been used to minimize distress and discomfort.

Adult Subjects:

Subjects were fully informed of all pertinent aspects of the clinical trial as well as the possibility to discontinue at any time in language and terms appropriate for the subject and considering the local culture. During the course of the trial, subjects were provided with individual subject cards indicating the nature of the trial the subject is participating, contact details and any information needed in the event of a medical emergency.

Collected personal data and human biological samples were processed in compliance with the Sanofi-Aventis Group Personal Data Protection Charter ensuring that the Group abides by the laws governing personal data protection in force in all countries in which it operates.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	14 May 2012
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	United Kingdom: 4
Country: Number of subjects enrolled	United States: 9
Country: Number of subjects enrolled	Mexico: 7
Country: Number of subjects enrolled	South Africa: 4
Worldwide total number of subjects	24
EEA total number of subjects	4

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	2
Adolescents (12-17 years)	10
Adults (18-64 years)	12
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

The study was conducted at 6 centres in 4 countries between 14 May 2012 and 04 March 2014.

Pre-assignment

Screening details:

A total of 78 subjects (25 paediatrics and 53 adults) were screened and 24 (12 in each paediatric and adult) subjects were randomized and treated.

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator

Arms

Are arms mutually exclusive?	Yes
Arm title	Paediatric

Arm description:

Paediatric subjects (10 years to less than [$<$] 18 years of age) received single dose of lixisenatide 5 microgram (mcg), 10 mcg and placebo (volume matched to lixisenatide 5 mcg or 10 mcg) as subcutaneous (SC) injection on Day 1 of either of the 3 treatment periods in a crossover design schedule with the administration of the 5 mcg dose preceding always the 10 mcg dose.

Arm type	Experimental-Placebo Cross-over
Investigational medicinal product name	Lixisenatide
Investigational medicinal product code	AVE0010
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Lixisenatide 5 microgram (mcg) or 10 mcg using the pen-type injector (OptiClik[®]), 30 minutes prior to a standardized liquid breakfast meal.

Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Placebo matched to lixisenatide using the pen-type injector (OptiClik[®]), 30 minutes prior to a standardized liquid breakfast meal.

Arm title	Adult
------------------	-------

Arm description:

Adult subjects (18 years to 65 years of age) received single dose of lixisenatide 5 mcg, 10 mcg and placebo (volume matched to lixisenatide 5 mcg or 10 mcg) as SC injection on Day 1 of either of the 3 treatment periods in a cross-over design schedule with the administration of the 5 mcg dose preceding always the 10 mcg dose.

Arm type	Experimental-Placebo Cross-over

Primary: Plasma Glucose Corrected Area Under The Plasma Concentration-Time Curve From Time 0.5 Hours to 4.5 Hours

End point title	Plasma Glucose Corrected Area Under The Plasma Concentration-Time Curve From Time 0.5 Hours to 4.5 Hours
-----------------	--

End point description:

Plasma glucose was assessed using the Gluco-quant Glucose/hexokinase assay. The range of the method was 3-1000 milligram per deciliter (mg/dL), with 1 mg/dL as limit of detection (LOD). Measurement was done using the linear trapezoidal rule from time of breakfast start (30 minutes after IMP injection [time: 0.5 hours]) to 4 hours after breakfast start (time: 4.5 hours) and corrected by subtracting premeal plasma glucose concentration (time: 0.5 hours). Evaluable pharmacodynamic (PD)

population included all randomized and treated subjects without any critical/major deviation related to IMP administration, for whom at least 1 PD parameter was considered sufficient and interpretable.

End point type	Primary
End point timeframe:

Secondary: Lixisenatide AUC(0:30-4:30h)

End point title	Lixisenatide AUC(0:30-4:30h)
-----------------	------------------------------

End point description:

Lixisenatide plasma concentrations were determined using a validated double-antibody sandwich enzyme-linked immunosorbent assay method with an LLOQ of 5.5 pg/mL. The area under the concentration time curve (AUC_{0:30-4:30h}) was calculated using the linear trapezoidal rule from time of breakfast start (30 minutes after IMP injection [time: 0.5 hours]) to 4 hours after breakfast start (time: 4.5 hours). Analysis was performed in evaluable PK population.

End point type	Secondary

Adverse events

Adverse events information

Timeframe for reporting adverse events:

All Adverse Events (AE) were collected from signature of the informed consent form up to the final visit (Day 2-7 after treatment period 3) regardless of seriousness or relationship to investigational product.

Adverse event reporting additional description:

Reported adverse events are treatment-emergent adverse events that is AEs that developed/worsened during the 'on treatment period' (the time from study drug injection up to 1 day after study drug injection [included] in each treatment period).

Assessment type	Systematic

Reporting groups

Reporting group title	Placebo: Paediatric
-----------------------	---------------------

Reporting group description:

Paediatric subjects (10 years to <18 years of age) who received single dose of placebo volume matched to either lixisenatide 5 mcg (50 mL) or lixisenatide 10 mcg (100 mL) by SC route.

Reporting group title	Lixisenatide 5 mcg: Paediatric
-----------------------	--------------------------------

Reporting group description:

Paediatric subjects (10 years to <18 years of age) who received single dose of lixisenatide 5 mcg (50 mL) by SC route (5 mcg preceding the 10 mcg lixisenatide dose level).

Reporting group title	Lixisenatide 10 mcg: Paediatric

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
04 June 2012	<p>In the context of this single dose study in paediatric and adult patients with Type 2 diabetes mellitus (T2DM) , information given in the clinical protocol about the measurement of plasma glucose in case of eventual hypoglycaemia was clarified. A new secondary endpoint, defined as the area under the plasma glucose concentration-time profile from time of the standardized breakfast start until 4 hours later (T4H30) without subtracting the premeal value, was included in addition to the similar primary endpoint defined as the area under the plasma glucose concentration-time profile from time of the standardized breakfast start until 4 hours later (T4H30) subtracting the premeal value.</p> <p>Moreover, detailed information for timing of metformin administration, if any, and Electrocardiogram were added and discrepancies between sections of the protocol were clarified.</p>
25 January 2013	<p>Change to the inclusion/exclusion criteria for the paediatric population.</p> <p>An upper limit of body mass index for paediatric subjects, that is, 50 kg/m^2 , was added to avoid inclusion of paediatric subjects with extreme obesity in this study.</p> <p>For the paediatric population: male or female subjects were eligible if their T2DM had been diagnosed at least 3 months earlier instead of 1 year at the time of screening. This was to facilitate the recruitment since in the management of T2DM in adolescents and children, therapy should be intensified whenever glucose control was not achieved after 3 to 6 months.</p> <p>For the paediatric population: systolic blood pressure (SBP)/diastolic blood pressure (DBP) levels were too restrictive for obese subjects taking into account the figures presented per age and height percentile. The exclusion would concern children/adolescents with abnormal blood pressure requiring pharmacological treatment as judged by the Investigator.</p> <p>Appendix B "Blood pressure levels by gender, age and height percentile" was consequently removed and the order of appendices following this initial Appendix B was revised and listed in the description of changes.</p>

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
