

## Clinical trial results:

### An International, Multicenter, Open-Label Study Evaluating Sustained Virological Response and Safety With Boceprevir in Triple Combination Therapy With Peginterferon Alfa-2a (40KD) and Ribavirin in Treatment-Naive Patients With Genotype 1 Chronic Hepatitis C

#### Summary

EudraCT number	2011-004810-41
Trial protocol	AT HU ES PL DE
Global end of trial date	20 June 2014

#### Results information

Result version number	v1 (current)
This version publication date	04 May 2016
First version publication date	07 August 2015

#### Trial information

##### Trial identification

Sponsor protocol code	MV28073
-----------------------	---------

##### Additional study identifiers

ISRCTN number	-
ClinicalTrials.gov id (NCT number)	NCT01591460
WHO universal trial number (UTN)	-

Notes:

#### Sponsors

Sponsor organisation name	F. Hoffmann-La Roche AG
Sponsor organisation address	Grenzacherstrasse 124, Basel, Switzerland, CH-4070
Public contact	Roche Trial Information Hotline , F. Hoffmann-La Roche AG, 41 61 6878333, global.trial_information@roche.com

Notes:

#### Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

## Results analysis stage

Analysis stage	Final
Date of interim/final analysis	26 August 2014
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	20 June 2014
Was the trial ended prematurely?	No

Notes:

## General information about the trial

Main objective of the trial:

This prospective, international, multicenter, open-label, uncontrolled Phase 3b/4 study in treatment-naïve participants with chronic hepatitis C (CHC) genotype 1 was designed to evaluate the efficacy and safety of triple combination therapy with peginterferon alfa-2a (PEG-IFN), ribavirin (RBV), and boceprevir when given as a response-guided treatment regimen for 28 to 48 weeks.

Protection of trial subjects:

The study was conducted in accordance with the principles of the Declaration of Helsinki and Good Clinical Practice (GCP) according to the regulations and procedures described in the protocol.

Investigators were trained according to applicable Sponsor Standard Operating Procedures (SOPs).

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	22 June 2012
Long term follow-up planned	Yes
Long term follow-up rationale	Safety, Efficacy
Long term follow-up duration	6 Months
Independent data monitoring committee (IDMC) involvement?	No

Notes:

## Population of trial subjects

### Subjects enrolled per country

Country: Number of subjects enrolled	Romania: 39
Country: Number of subjects enrolled	Poland: 45
Country: Number of subjects enrolled	Spain: 21
Country: Number of subjects enrolled	Austria: 21
Country: Number of subjects enrolled	Germany: 8
Country: Number of subjects enrolled	Hungary: 31
Worldwide total number of subjects	165
EEA total number of subjects	165

Notes:

### Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0

Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	153
From 65 to 84 years	12
85 years and over	0

## Subject disposition

### Recruitment

Recruitment details: -

### Pre-assignment

Screening details:

The study consisted of a Screening phase which began within up to 4 weeks (in exceptional cases up to 8 weeks) prior to the first dose of study medication. Inclusion/exclusion criteria were checked.

### Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Not applicable
Blinding used	Not blinded

### Arms

Arm title	Total Population
-----------	------------------

Arm description:

Treatment-naïve participants with CHC received treatment with PEG-IFN 180 micrograms (mcg) subcutaneous (SC) once weekly, weight-based RBV 1000 to 1200 milligrams (mg) orally (PO) daily in 2 divided doses, and boceprevir 800 mg PO every 7 to 9 hours. Participants received dual therapy with PEG-IFN and RBV from Week 0 to 4, and triple therapy was initiated at Week 4. Those with undetectable hepatitis C virus (HCV) ribonucleic acid (RNA) at Weeks 8 and 24 stopped treatment at Week 28. Those with detectable HCV RNA at Week 8 but undetectable HCV RNA at Week 24 continued triple therapy until Week 36 and received dual therapy from Week 36 to 48. Those with a less than (<) 1-log decrease in HCV RNA at Week 4 continued triple therapy until Week 48, with optional dual therapy from Week 32 to 48 if triple therapy was not tolerated. Participants with compensated cirrhosis, regardless of response, received triple therapy until Week 48.

Arm type	Experimental
Investigational medicinal product name	Peginterferon alfa-2a
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Participants received PEG-IFN 180 mcg SC once weekly for up to 48 weeks.

Investigational medicinal product name	Ribavirin
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Film-coated tablet
Routes of administration	Oral use

Dosage and administration details:

Participants received weight-based RBV 1000 to 1200 mg PO daily in 2 divided doses for up to 48 weeks.

Investigational medicinal product name	Boceprevir
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Capsule, hard
Routes of administration	Oral use

Dosage and administration details:

Participants received boceprevir 800 mg PO every 7 to 9 hours for up to 44 weeks.

<b>Number of subjects in period 1</b>	Total Population
Started	165
Completed	139
Not completed	26
Consent withdrawn by subject	1
Protocol violation	1
Rebound or breakthrough	3
Futility rule (Week 24)	3
Participant refusal	3
Lost to follow-up	1
Treatment discontinued by error	1
Futility rule (Week 12)	7
Adverse event or intercurrent illness	5
Noncompliance	1

## Baseline characteristics

### Reporting groups

Reporting group title	Total Population
-----------------------	------------------

Reporting group description:

## End points

### End points reporting groups

Reporting group title	Total Population
-----------------------	------------------

Reporting group description:

Treatment-naïve participants with CHC received treatment with PEG-IFN 180 micrograms (mcg) subcutaneous (SC) once weekly, weight-based RBV 1000 to 1200 milligrams (mg) orally (PO) daily in 2 divided doses, and boceprevir 800 mg PO every 7 to 9 hours. Participants received dual therapy with PEG-IFN and RBV from Week 0 to 4, and triple therapy was initiated at Week 4. Those with undetectable hepatitis C virus (HCV) ribonucleic acid (RNA) at Weeks 8 and 24 stopped treatment at Week 28. Those with detectable HCV RNA at Week 8 but undetectable HCV RNA at Week 24 continued triple therapy until Week 36 and received dual therapy from Week 36 to 48. Those with a less than (<) 1-log decrease in HCV RNA at Week 4 continued triple therapy until Week 48, with optional dual therapy from Week 32 to 48 if triple therapy was not tolerated. Participants with compensated cirrhosis, regardless of response, received triple therapy until Week 48.

Subject analysis set title	Cirrhotics
Subject analysis set type	Full analysis

Subject analysis set description:

Treatment-naïve participants with CHC received treatment with PEG-IFN 180 mcg SC once weekly, weight-based RBV 1000 to 1200 mg PO daily in 2 divided doses, and boceprevir 800 mg PO every 7 to 9 hours. Participants received dual therapy with PEG-IFN and RBV from Week 0 to 4, and triple therapy was initiated at Week 4. Response-guided treatment was determined by assessments of virologic response at Weeks 4, 8, and 24. Participants with compensated cirrhosis (Cirrhotics), regardless of response, received triple therapy until Week 48.

Subject analysis set title	Poor Responders
Subject analysis set type	Full analysis

Subject analysis set description:

Treatment-naïve participants with CHC received treatment with PEG-IFN 180 mcg SC once weekly, weight-based RBV 1000 to 1200 mg PO daily in 2 divided doses, and boceprevir 800 mg PO every 7 to 9 hours. Participants received dual therapy with PEG-IFN and RBV from Week 0 to 4, and triple therapy was initiated at Week 4. Response-guided treatment was determined by assessments of virologic response at Weeks 4, 8, and 24. Those without cirrhosis and with a <1-log decrease in HCV RNA at Week 4 (Poor Responders) continued triple therapy until Week 48, with optional dual therapy from Week 32 to 48 if triple therapy was not tolerated.

Subject analysis set title	Late Responders
Subject analysis set type	Full analysis

Subject analysis set description:

Treatment-naïve participants with CHC received treatment with PEG-IFN 180 mcg SC once weekly, weight-based RBV 1000 to 1200 mg PO daily in 2 divided doses, and boceprevir 800 mg PO every 7 to 9 hours. Participants received dual therapy with PEG-IFN and RBV from Week 0 to 4, and triple therapy was initiated at Week 4. Response-guided treatment was determined by assessments of virologic response at Weeks 4, 8, and 24. Those without cirrhosis and with detectable HCV RNA at Week 8 but undetectable HCV RNA at Week 24 (Late Responders) continued triple therapy until Week 36 and received dual therapy from Week 36 to 48.

Subject analysis set title	Early Responders
Subject analysis set type	Full analysis

Subject analysis set description:

Treatment-naïve participants with CHC received treatment with PEG-IFN 180 mcg SC once weekly, weight-based RBV 1000 to 1200 mg PO daily in 2 divided doses, and boceprevir 800 mg PO every 7 to 9 hours. Participants received dual therapy with PEG-IFN and RBV from Week 0 to 4, and triple therapy was initiated at Week 4. Response-guided treatment was determined by assessments of virologic response at Weeks 4, 8, and 24. Those without cirrhosis and with undetectable HCV RNA at Weeks 8 and 24 (Early Responders) stopped treatment at Week 28.

Subject analysis set title	Others
Subject analysis set type	Full analysis

Subject analysis set description:

Treatment-naïve participants with CHC received treatment with PEG-IFN 180 mcg SC once weekly, weight-based RBV 1000 to 1200 mg PO daily in 2 divided doses, and boceprevir 800 mg PO every 7 to 9 hours. Participants received dual therapy with PEG-IFN and RBV from Week 0 to 4, and triple therapy was initiated at Week 4. Response-guided treatment was determined by assessments of virologic

response at Weeks 4, 8, and 24. Those not meeting criteria for the other treatment groups (Cirrhotics, Poor Responders, Late Responders, or Early Responders) were classified separately (as Others) and were not treated per response-guided therapy.

### **Primary: Percentage of Participants With Sustained Virological Response (SVR) at 12 Weeks After End of Treatment (EOT)**

End point title	Percentage of Participants With Sustained Virological Response (SVR) at 12 Weeks After End of Treatment (EOT) <sup>[1]</sup>
-----------------	--

End point description:

SVR at 12 weeks after EOT was defined as an undetectable HCV RNA viral load obtained 12 weeks following completion of treatment. HCV RNA viral load was measured using the Roche COBAS TaqMan 2.0 HCV Test, with a lower limit of detection (LOD) of 10 to 15 international units per milliliter (IU/mL). The percentage of participants with SVR was calculated as [number of participants with undetectable HCV RNA at 12 weeks after EOT divided by the number of participants analyzed] multiplied by 100. All-Treated Population: All enrolled participants who received at least one dose of study medication. Arms were not mutually exclusive.

End point type	Primary
----------------	---------

End point timeframe:

At 12 weeks after EOT (up to 60 weeks)

Notes:

[1] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: The study was of an explorative nature; therefore only descriptive and exploratory statistical methods were applied, and no statistical hypothesis testing was carried out.

## Secondary: Percentage of Participants With at Least a 1-Log, 2-Log, or 3-Log Reduction in HCV RNA

End point title	Percentage of Participants With at Least a 1-Log, 2-Log, or 3-Log Reduction in HCV RNA
-----------------	--

End point description:

HCV RNA levels were obtained routinely during and after treatment. Reductions in HCV RNA viral load by 1-log, 2-log, or 3-log increments were determined relative to Baseline HCV RNA. Each increment represents a reduction greater than or equal to ( $\geq$ ) the specified log value, including results for which HCV RNA was below the limit of quantification (25 IU/mL). The percentage of participants with each log reduction in HCV RNA was calculated as [number of participants with log reduction divided by the number of participants analyzed] multiplied by 100. All-Treated Population. Arms were not mutually exclusive.

## Secondary: Percentage of Participants With Virological Relapse Following EOT Response

End point title	Percentage of Participants With Virological Relapse Following EOT Response
-----------------	--

End point description:

Virological relapse was defined as a detectable post-treatment HCV RNA viral load following a previously undetectable EOT level (ie, virological response). The percentage of participants with virological relapse was calculated as [number of participants meeting the above criteria divided by the number of participants analyzed] multiplied by 100. All-Treated Population. Arms were not mutually exclusive.

End point type	Secondary
----------------	-----------

End point timeframe:

Up to 72 weeks (at 12 and 24 weeks after EOT)

## Secondary: Percentage of Participants With Treatment Discontinued Based Upon Elevated (Week 12) or Detectable (Week 24) HCV RNA

End point title	Percentage of Participants With Treatment Discontinued Based Upon Elevated (Week 12) or Detectable (Week 24) HCV RNA
-----------------	--

End point description:

Treatment was to be discontinued for participants who met prespecified criteria, termed the futility rule, after 12 or 24 weeks of treatment. Participants were discontinued from treatment for one of the following reasons: HCV RNA viral load  $\geq 100$  IU/mL (Week 12) or a detectable HCV RNA viral load (Week 24). HCV RNA viral load was measured using the Roche COBAS TaqMan 2.0 HCV Test, with a lower LOD of 10 to 15 IU/mL. The percentage of participants with treatment discontinued for each reason was calculated as [number of participants meeting one of the above criteria divided by the number of participants analyzed] multiplied by 100. All-Treated Population. Arms were not mutually exclusive.

## Secondary: Percentage of Participants Receiving Target Administrations of PEG-IFN, RBV, and Boceprevir

End point title	Percentage of Participants Receiving Target Administrations of PEG-IFN, RBV, and Boceprevir
End point description:	
The frequency of missed treatments was examined using the number of administrations received as a percentage of target administrations for each study drug. The maximum number of possible administrations was considered in terms of once-weekly injections with PEG-IFN and in terms of treatment days with RBV and boceprevir. The percentage of target administrations each participant received was separated into ranges of <60%, 60 to <80%, 80 to <95%, and ≥95% for each study drug. The percentage of participants who received each range of target administrations was calculated as [number of participants in each range divided by the number of participants analyzed] multiplied by 100. Safety Population. Arms were not mutually exclusive.

Dictionary version	17.1
--------------------	------

### Reporting groups

Reporting group title	Cirrhotics (Safety)
-----------------------	---------------------

Reporting group description:

Treatment-naïve participants with CHC received treatment with PEG-IFN 180 mcg SC once weekly, weight-based RBV 1000 to 1200 mg PO daily in 2 divided doses, and boceprevir 800 mg PO every 7 to 9 hours. Participants received dual therapy with PEG-IFN and RBV from Week 0 to 4, and triple therapy was initiated at Week 4. Those with undetectable HCV RNA at Weeks 8 and 24 stopped treatment at Week 28. Those with detectable HCV RNA at Week 8 but undetectable HCV RNA at Week 24 continued triple therapy until Week 36 and received dual therapy from Week 36 to 48. Those with a <1-log decrease in HCV RNA at Week 4 continued triple therapy until Week 48, with optional dual therapy from Week 32 to 48 if triple therapy was not tolerated. Participants with compensated cirrhosis, regardless of response, received triple therapy until Week 48. Participants with liver cirrhosis were grouped separately in the safety analysis.

Reporting group title	Noncirrhotics (Safety)
-----------------------	------------------------

Reporting group description:

Treatment-naïve participants with CHC received treatment with PEG-IFN 180 mcg SC once weekly, weight-based RBV 1000 to 1200 mg PO daily in 2 divided doses, and boceprevir 800 mg PO every 7 to 9 hours. Participants received dual therapy with PEG-IFN and RBV from Week 0 to 4, and triple therapy was initiated at Week 4. Those with undetectable HCV RNA at Weeks 8 and 24 stopped treatment at Week 28. Those with detectable HCV RNA at Week 8 but undetectable HCV RNA at Week 24 continued triple therapy until Week 36 and received dual therapy from Week 36 to 48. Those with a <1-log decrease in HCV RNA at Week 4 continued triple therapy until Week 48, with optional dual therapy from Week 32 to 48 if triple therapy was not tolerated. Participants with compensated cirrhosis, regardless of response, received triple therapy until Week 48. Participants without liver cirrhosis, including those with transition to cirrhosis, were grouped separately in the safety analysis.
