① The table defaults provide a short-cut for entering the dictionary used for recording all Adverse events in a study. If entered, the table default values respectively apply to any Adverse Event with a blank Dictionary name.

② The frequency of non-serious adverse events that, when exceeded within any arm or comparison group, are reported in the results database for all arms or comparison groups. The number must be less than or equal to the allowed maximum expressed as a percentage. For example, a threshold of 5 per cent indicates that all non-serious adverse events with a frequency greater than 5 per cent within at least one arm or comparison group are reported.

③ Reporting group description contains details about subjects in this group.

④ Number of subjects exposed for a single Adverse event in a reporting group is only required when the value differs from the Total number of subjects at exposed in the reporting group.

⑤ The event terms used for reporting fatalities must also appear in the serious adverse events table.
