

Clinical trial results:

A phase III, open, randomized, controlled, multi-centre study to demonstrate the non-inferiority of the meningococcal serogroup C and the Haemophilus influenzae type b immune response of GlaxoSmithKline (GSK) Biologicals' conjugate Hib-MenC vaccine co-administered with GSK Biologicals' measles-mumps-rubella vaccine, Priorix™, versus MenC-CRM197 conjugate vaccine co-administered with GSK Biologicals' Hib vaccine, Hiberix™, and Priorix™ in 12- to 18-month-old toddlers primed in infancy with a Hib vaccine but not with a meningococcal serogroup C vaccine; and to evaluate the long-term antibody persistence up to 5 years after the administration of the Hib-MenC vaccine.

Summary

EudraCT number	2011-005032-26
Trial protocol	Outside EU/EEA

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	Yes

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	08 February 2013
Is this the analysis of the primary completion data?	Yes
Primary completion date	06 October 2012
Global end of trial reached?	Yes
Global end of trial date	06 October 2012
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

One month after vaccination:

To demonstrate the non-inferiority of the meningococcal serogroup C and Hib responses induced by Hib-MenC vaccine, compared to separately administered MCC and Hib vaccines (with MMR co-administered in each group), when given as a single dose to toddlers 12-18 months of age primed with routine infant vaccines including Hib, but no MenC vaccine, in terms of:

- Percentage of subjects with meningococcal serogroup C serum bactericidal assay using rabbit complement (rSBA-MenC) titer $\geq 1:8$.
- Percentage of subjects with anti-polyribosylribitol phosphate (anti-PRP) antibody concentration ≥ 0.15 $\mu\text{g/mL}$

Protection of trial subjects:

All subjects were supervised for 30 min after vaccination/product administration with appropriate medical treatment readily available. Vaccines/products were administered by qualified and trained personnel. Vaccines/products were administered only to eligible subjects that had no contraindications to any components of the vaccines/products. Subjects were followed-up for 30 days after the last vaccination/product administration.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	17 June 2011
Long term follow-up planned	Yes
Long term follow-up rationale	Safety, Efficacy
Long term follow-up duration	5 Years
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Australia: 433
--------------------------------------	----------------

Worldwide total number of subjects	433
EEA total number of subjects	0

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	433
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	0
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details: -

Pre-assignment

Screening details:

During the screening the following steps occurred: check for inclusion/exclusion criteria, contraindications/precautions, medical history of the subjects and signing informed consent forms.

Period 1

Period 1 title	Overall study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	Menitorix Group

Arm description:

Subjects received a single dose of Menitorix™ vaccine co-administered with Priorix™ vaccine. Menitorix vaccine was administered intramuscularly in the left deltoid region and the Priorix vaccine was administered subcutaneously in the right upper arm.

Arm type	Experimental
Investigational medicinal product name	Menitorix™
Investigational medicinal product code	
Other name	Hib-MenC
Pharmaceutical forms	Injection
Routes of administration	Intramuscular use

Dosage and administration details:

One intramuscular dose at 12-18 months of age, administered in the left deltoid region.

Investigational medicinal product name	Priorix™
Investigational medicinal product code	
Other name	MMR
Pharmaceutical forms	Injection
Routes of administration	Subcutaneous use

Dosage and administration details:

One subcutaneous dose at 12-18 months of age, administered in the right upper arm.

Arm title	Meningitec + Hiberix Group
------------------	----------------------------

Arm description:

Subjects received a single dose of Meningitec™ vaccine co-administered with Hiberix™ and Priorix™ vaccines. The Meningitec vaccine was administered intramuscularly in the left deltoid region, the Hiberix vaccine was administered intramuscularly in the left thigh region and the Priorix vaccine was administered subcutaneously in the right upper arm.

Arm type	Experimental
Investigational medicinal product name	Meningitec™
Investigational medicinal product code	
Other name	MCC
Pharmaceutical forms	Injection
Routes of administration	Intramuscular use

Dosage and administration details:

One intramuscular dose at 12-18 months of age, administered in the left deltoid region.

Investigational medicinal product name	Hiberix™
Investigational medicinal product code	
Other name	Hib
Pharmaceutical forms	Injection
Routes of administration	Intramuscular use

Dosage and administration details:

One intramuscular dose at 12-18 months of age, administered in the left thigh region.

Investigational medicinal product name	Priorix™
Investigational medicinal product code	
Other name	MMR
Pharmaceutical forms	Injection
Routes of administration	Subcutaneous use

Dosage and administration details:

One subcutaneous dose at 12-18 months of age, administered in the right upper arm.

subjects affected / exposed	40 / 324 (12.35%)	15 / 109 (13.76%)	
occurrences (all)	40	15	

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
28 July 2006	The primary vaccination calendar in Australia was modified since the release of the present protocol, ie Hib-TT combined with DTPa containing vaccine are now routinely given to infants in some regions. As a result, the inclusion criteria and the statistical section have been amended to take into account these changes.
26 February 2007	<p>In order to improve the enrolment of subjects in the study, some sites may perform home visits. At the first home visit, the parents/guardians will be asked to sign a preinformed consent to allow the sites to collect some personal identifying information. This information will be recorded on a register which will help GSK and the study staff better prepare for and manage the first study visit if the parent/guardian subsequently decide to have their child/ward participate in the study.</p> <p>In order to be consistent throughout all study visits, the physical examinations during the persistence phase of the study do not need to be performed by the investigator. In protocol amendment 1, it was planned to perform all laboratory assays at Rixensart. The protocol was amended to allow for other validated laboratories designated by GSK Biologicals to perform the assays, if needed.</p>
27 March 2012	<p>To support the data obtained by serum bactericidal assay (SBA) testing, antibody concentrations against meningococcal polysaccharides (PSs) were planned to be assessed by enzyme-linked immunosorbent assay (ELISA). The ELISA testing was performed at month 0, month 1 and 1, 2 and 3 years after vaccine administration, but the sponsor decided not to perform the ELISA testing at 4 and 5 years after vaccine administration for the following reasons:</p> <ul style="list-style-type: none">- the World Health Organisation (WHO) considers SBA the primary means of assessing immune response to meningococcal conjugate vaccines [WHO, 2006; WHO, 1999].- circulating bactericidal antibodies are more critical for persistent protection against meningococcal disease than non-functional antibodies against meningococcal polysaccharides [CDC, 2011; WHO, 2006]. <p>Although antibody concentrations will not be determined by ELISA at 4 and 5 years after vaccine administration, all subjects will be informed of their SBA antibody titers at each immunogenicity time point when statistical analyses at that time point have been completed.</p> <p>In addition, the protocol amendment clarifies in which laboratory the different assays will be performed.</p>

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
