

Clinical trial results:

A UK open-label, multicentre, exploratory Phase II study of INC424 for patients with primary myelofibrosis (PMF) or post polycythemia myelofibrosis (PPV MF) or post-essential thrombocythemia myelofibrosis (PET-MF)

Summary

EudraCT number	2011-005066-38

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	28 January 2014
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	28 January 2014
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

To evaluate the efficacy of daily oral doses of 15mg BID or 20mg BID of INC424 in patients with PMF, PPV-MF, or PET-MF, based on the proportion of patients experiencing treatment success at the 48 week timepoint. Treatment success was defined as:

- 50% or greater reduction in palpable spleen length versus Baseline at the 48-week time point and/or
- 50% or greater improvement in total symptom scores (derived from MF symptom assessment form [MFSAF] questionnaire) versus Baseline at the 48-week time point

Protection of trial subjects:

The study was in compliance with the ethical principles derived from the Declaration of Helsinki and the International Conference on Harmonization (ICH) Good Clinical Practice (GCP) Guidelines. All the local regulatory requirements pertinent to safety of trial subjects were also followed during the conduct of the trial.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	01 May 2012
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	United Kingdom: 48
Worldwide total number of subjects	48
EEA total number of subjects	48

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0

Adults (18-64 years)	15
From 65 to 84 years	31
85 years and over	2

Subject disposition

Recruitment

Recruitment details:

Fifty-four patients were screened. Forty-eight subjects were enrolled. All sites were in the United Kingdom.

Pre-assignment

Screening details:

Screening details:

Screening period duration was Day - 28 to Day -1.

Fifty-four patients were screened and 6 were discontinued: 4 for unacceptable test procedure result, 1 withdrew consent, and 1 for "other".

Period 1

Period 1 title	Treatment (overall period)
Is this the baseline period?	Yes
Allocation method	Not applicable
Blinding used	Not blinded

Arms

Arm title	Oral INC424 at a dose of 15 or 20 mg twice daily
-----------	--------------------------------------------------

Arm description:

Patients diagnosed with PMF, PPV MF, or PET-MF were treated with oral INC424 at a dose of 15 - 20 mg (dose based on Baseline platelet count) twice daily.

Arm type	Experimental
Investigational medicinal product name	Ruxolitinib
Investigational medicinal product code	INC424
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Starting dose (Patients with platelet counts less than 100,000 L were ineligible for the study):

- Patients with a Baseline platelet count of > 200,000/ μ L began dosing at 20 mg per os (p.o.) BID (four 5 mg tablets BID).
- Patients with a Baseline platelet count between 100,000 – 200,000/ μ L (inclusive) began dosing at 15 mg p.o. BID (three 5 mg tablets BID).

Dose could be increased by 5 mg BID (for optimization of dosing) after at least Week 4 (Month 1) for patients who met all of the following conditions:

- Palpable spleen length below the costal margin that decreased by less than 40% at the Week 4 visit relative to Baseline.
- Platelet count at the Week 4 blood draw was > 150,000/ μ L and platelet count had never been below 150,000/ μ L at a prior laboratory evaluation while receiving ruxolitinib.
- ANC levels had remained at or above 1000/ μ L since enrollment in the study.

Guidance was provided for decreasing, interruption or discontinuation of study drug.

Number of subjects in period 1	Oral INC424 at a dose of 15 or 20 mg twice daily
Started	48
Completed	31
Not completed	17
Consent withdrawn by subject	2
Adverse event, non-fatal	7
Death	3
Lack of efficacy	4
Protocol deviation	1

Baseline characteristics

Reporting groups

Reporting group title	Treatment
Reporting group description:	
Patients diagnosed with PMF, PPV MF, or PET-MF were treated with oral INC424 at a dose of 15 - 20 mg (dose based on Baseline platelet count) twice daily.

Male	27	27	

Subject analysis sets

Subject analysis set title	Full Analysis Set and Safety Set
Subject analysis set type	Full analysis

Subject analysis set description:

The Full Analysis set (FAS) consisted of all patients who received at least one administration of study drug and had at least one post-Baseline efficacy assessment.

The Safety set consisted of all patients who received at least one dose of study drug and had at least one post-Baseline safety assessment. The statement that a patient had no AEs constituted a safety assessment. Patients who had received at least one dose of study drug but who had no post-treatment safety data of any kind were excluded from the safety population.

End points

End points reporting groups

Reporting group title	Oral INC424 at a dose of 15 or 20 mg twice daily
-----------------------	--------------------------------------------------

Reporting group description:

Patients diagnosed with PMF, PPV MF, or PET-MF were treated with oral INC424 at a dose of 15 - 20 mg (dose based on Baseline platelet count) twice daily.

Subject analysis set title	Full Analysis Set and Safety Set
----------------------------	----------------------------------

Subject analysis set type	Full analysis
---------------------------	---------------

Subject analysis set description:

The Full Analysis set (FAS) consisted of all patients who received at least one administration of study drug and had at least one post-Baseline efficacy assessment.

The Safety set consisted of all patients who received at least one dose of study drug and had at least one post-Baseline safety assessment. The statement that a patient had no AEs constituted a safety assessment. Patients who had received at least one dose of study drug but who had no post-treatment safety data of any kind were excluded from the safety population.

Primary: Percentage of Participants With Treatment Success at Week 48

End point title	Percentage of Participants With Treatment Success at Week
-----------------	-----------------------------------------------------------

End point description:

Treatment success was defined as a 50% or greater reduction in palpable spleen length versus baseline at 48 weeks and/or a 50% or greater improvement in total symptom score (derived from the MF symptom assessment form (MFSAF) questionnaire) versus baseline at the week 48 time point. The MFSAF assesses the following symptoms (all scored from absent (0) to worst imaginable (10)): general fatigue, abdominal pain (and discomfort), inactivity (ability to move and walk around), cough, night sweats, itching (pruritus), bone pain (diffuse not joint pain or arthritis), fever, change in appetite/unintentional weight loss (or gain) in past 6 months, overall quality of life (QoL).

Full analysis set (FAS): The FAS included all participants who received at least one administration of study drug and had at least one post-baseline efficacy assessment.

End point type	Primary
----------------	---------

End point timeframe:

Baseline versus 48 week end of treatment.

Notes:

[1] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: The primary objective of the study was to provide an estimate of the ability of daily oral doses of 15 or 20 mg BID of ruxolitinib to produce treatment success in patients with PMF, PPV MF or PET-MF at Week 48.

Analysis focused on estimation (point estimate together with 95% confidence interval [CI]). The proportion of patients with treatment response at Week 48 was estimated using an exact (Clopper-Pearson) 95% CI. No statistical hypothesis testing done.

End point values	Oral INC424 at a dose of 15 or 20 mg twice daily

Secondary: Change From Baseline in Myelofibrosis Symptoms Assessment Form (MF-SAF)

End point title	Change From Baseline in Myelofibrosis Symptoms Assessment Form (MF-SAF)
-----------------	-------------------------------------------------------------------------

End point description:

The MF-SAF consists of seven questions about key symptoms and impact of MF. Questions are scored on a scale of 0–10, with higher scores indicating more severe symptoms and greater inactivity. Questions 1–6, which together comprise a Total Symptom Score (TSS), investigate the following symptoms: night

sweats, pruritus/itching, abdominal discomfort, pain under the ribs, early satiety and bone/muscle pain. Question 7 asks patients to report levels of inactivity. The TSS reflects the sum of the scores of these symptoms excluding inactivity, with the maximum possible score being 60 (most severe symptom experienced).

Only participants from the full analysis set (FAS), who had evaluable measurements at both baseline and the post-baseline week time point, was included in the analysis for that time point. The FAS included all participants who received at least one administration of study drug and had at least one post-baseline efficacy assessment.

End point type	Secondary

Secondary: Change From Baseline in EQ5D Preference Index (5 Level EuroQol Questionnaire Determining Quality of Life) From Baseline

End point title	Change From Baseline in EQ5D Preference Index (5 Level EuroQol Questionnaire Determining Quality of Life) From Baseline
-----------------	-------------------------------------------------------------------------------------------------------------------------

End point description:

The EQ-5D is a standardized instrument used for measuring health outcomes in a wide range of health conditions and treatment. It consists of a descriptive system and a visual analogue scale (EQ-VAS). The descriptive system comprises the following 5 dimensions: mobility, self-care, usual activities, pain/discomfort and anxiety/depression. Each dimension has 3 levels: no problems, some problems, and extreme problems. The EQ-VAS records the participant's self-rated health on a vertical, VAS where the endpoints are labeled 'best imaginable health state' and 'worst imaginable health state'. The EQ-5D health state was converted to a single summary index by applying a formula that attaches a weight to each of the levels in each dimension. The final EQ5D preference index scores range from 0 to 1 with higher scores indicating better health.

Only participants from the full analysis set (FAS), who had evaluable measurements at both baseline and the post-baseline week time point, was included in

Adverse events

Adverse events information

Timeframe for reporting adverse events:

Adverse Events are collected from First Patient First Visit (FPFV) until Last Patient Last Visit (LPLV). All Adverse events are reported in this record from First Patient First Treatment until Last Patient Last Visit.

Adverse event reporting additional description:

Consistent with EudraCT disclosure specifications, Novartis has reported under the Serious adverse events field "number of deaths resulting from adverse events" all those deaths, resulting from serious adverse events that are deemed to be causally related to treatment by the investigator.

Musculoskeletal and connective tissue disorders			

Arthralgia subjects affected / exposed occurrences (all)	4 / 48 (8.33%) 5		
Back pain subjects affected / exposed occurrences (all)	6 / 48 (12.50%) 7		
Flank pain subjects affected / exposed occurrences (all)	3 / 48 (6.25%) 3		
Muscle spasms subjects affected / exposed occurrences (all)	7 / 48 (14.58%) 7		
Pain in extremity subjects affected / exposed occurrences (all)	4 / 48 (8.33%) 5		
Infections and infestations Urinary tract infection subjects affected / exposed occurrences (all)	8 / 48 (16.67%) 8		
Upper respiratory tract infection subjects affected / exposed occurrences (all)	5 / 48 (10.42%) 6		
Nasopharyngitis subjects affected / exposed occurrences (all)	3 / 48 (6.25%) 3		
Lower respiratory tract infection subjects affected / exposed occurrences (all)	7 / 48 (14.58%) 8		
Metabolism and nutrition disorders Gout subjects affected / exposed occurrences (all)	5 / 48 (10.42%) 6		

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
31 January 2012	Amendment 1 was issued prior to recruitment of the first patient, introduced the following changes: The primary endpoint was amended to incorporate a composite endpoint (i.e. reduction in spleen size and or reduction in total symptom scores).
02 August 2012	Amendment 2 was issued after the inclusion of approximately 50% of patients and introduced changes: The number of patients included in the trial was increased from 33 to 45 patients to allow more patients. The sample size calculation was updated to reflect the increased number of patients that would be analyzed in the trial.
24 June 2013	Amendment 3 was issued after the inclusion of 100% of patients and introduced the following changes: Since the first patient was enrolled into the study, the understanding of ruxolitinib in the treatment of MPNs had changed and thus revisions of the protocol were necessary to adapt these new findings. An interim analysis was also added.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
