Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	06 February 2015
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	06 February 2015
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary objective of this study was to explore the efficacy of mavrilimumab compared with golimumab in the treatment of adult participants 18-80 years of age with moderate-to-severe active rheumatoid arthritis (RA) who had an inadequate response to one or more conventional disease-modifying anti-rheumatic drugs (DMARDs) and/or one or two anti-tumor necrosis factor (TNF) agents (excluding golimumab) for efficacy or safety reasons.

Protection of trial subjects:

The conduct of this clinical study met all local legal and regulatory requirements. The study was conducted in accordance with the ethical principles that have their origin in the Declaration of Helsinki and the International Conference on Harmonization guideline E6: Good Clinical Practice. Participating participant signed informed consent form and could withdraw from the study at any time without any disadvantage and without having to provide a reason for this decision. Only investigators qualified by training and experience were selected as appropriate experts to investigate the study drug.

Background therapy:

Participants with inadequate response to one or more conventional DMARDs and/or participants previously treated with one or two anti-TNF agents other than golimumab given for at least 3 months at various doses where the last agent was discontinued within 2 years prior to Day 1 due to inadequate response, safety, or intolerance, with the exception of the occurrence of serious adverse events (SAEs). Recommended Dose Regimens of Previous Anti-TNF Treatment were Adalimumab (Dosage of at least 40 milligram [mg] every other week subcutaneous route), Infliximab (Dosage of at least 3 milligram per kilogram [mg/kg] at Weeks 0, 2, and 6, followed by a maintenance dose every 8 weeks thereafter intravenous route), Etanercept (Dosage of at least 25 mg administered twice weekly or 50 mg once weekly subcutaneous route) and Certolizumab (Dosage of 400 mg at Weeks 0, 2, and 4, followed by a maintenance dose of 200 mg every 2 weeks subcutaneous route). 'The last dose of anti-TNF agent should have been given at least 8 weeks prior to Day 1.

Evidence for comparator: -

Actual start date of recruitment	19 March 2013
Long term follow-up planned	Yes
Long term follow-up rationale	Safety
Long term follow-up duration	3 Months
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Argentina: 21
Country: Number of subjects enrolled	Colombia: 10
Country: Number of subjects enrolled	Czech Republic: 26
Country: Number of subjects enrolled	Greece: 5
Country: Number of subjects enrolled	Hungary: 5
Country: Number of subjects enrolled	Israel: 12

Country: Number of subjects enrolled	Mexico: 12
Country: Number of subjects enrolled	Portugal: 2
Country: Number of subjects enrolled	Russian Federation: 22
Country: Number of subjects enrolled	Serbia: 5
Country: Number of subjects enrolled	Slovakia: 1
Country: Number of subjects enrolled	Spain: 6
Country: Number of subjects enrolled	United Kingdom: 11
Worldwide total number of subjects	138
EEA total number of subjects	56

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	118
From 65 to 84 years	20
85 years and over	0

Subject disposition

Recruitment

Recruitment details: -

Pre-assignment

Screening details:

Overall, 215 participants were screened, of which 77 participants were considered as screen failures and 138 participants were randomized and completed in the study.

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Carer, Assessor

Arms

Are arms mutually exclusive?	Yes
Arm title	Golimumab 50 mg alternating with Placebo

Arm description:

Participants received alternating doses of golimumab 50 mg (Weeks 0, 4, 8, 12, 16, 20, and 24) and placebo matched to mavrilimumab (Weeks 2, 6, 10, 14, 18, and 22) injections subcutaneously every 2 weeks for 24 weeks in combination with stable dose of methotrexate (7.5 to 25 mg per week) through oral or parenteral route.

Arm type	Experimental
Investigational medicinal product name	Golimumab
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection in pre-filled syringe
Routes of administration	Subcutaneous use

Dosage and administration details:

Participants received golimumab 50 mg (Weeks 0, 4, 8, 12, 16, 20, and 24) injections subcutaneously for 24 weeks in combination with stable dose of methotrexate (7.5 to 25 mg per week) through oral or parenteral route.

Investigational medicinal product name	Placebo matched to mavrilimumab
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Placebo matched to mavrilimumab (Weeks 2, 6, 10, 14, 18, and 22) injections subcutaneously in combination with stable dose of methotrexate (7.5 to 25 mg per week) through oral or parenteral route.

Arm title	Mavrilimumab 100 mg
------------------	---------------------

Arm description:

Participants received mavrilimumab 100 mg injection subcutaneously every 2 weeks for 24 weeks in combination with stable dose of methotrexate (7.5 to 25 mg per week) through oral or parenteral route.

Arm type	Experimental
Investigational medicinal product name	Mavrilimumab
Investigational medicinal product code	CAM-3001
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Subjects received mavrilimumab 100 mg injection subcutaneously every 2 weeks for 24 weeks.

End point title	Percentage of Participants who Achieved Disease Activity Score of 28 Joints Using C-Reactive Protein (DAS28 [CRP]) Response at Day 169
-----------------	--

End point description:

The DAS28 (CRP) was calculated from the number of SJC and TJC using the 28 joints count, The DAS28(CRP) considers 28 of the 68 TJC and 28 of the 66 SJC and participant's global health (GH) using PGA of disease activity using the visual analogue scale (VAS) of 0 (= best), 100 (= worst) plus levels of CRP (milligram/Liter [mg/L]). Total score range: 0-9.4, higher score= more disease activity. DAS28 (CRP) less than (<) 3.2 = low disease activity, >=3.2 to 5.1 = moderate to high disease activity and <2.6= remission. Participants with score less than 2.6 were analysed. The mITT population analysis set included all participants in the treatment group corresponding to their randomized treatment group.

Secondary: Number of Participants With Treatment-Emergent Adverse Events (TEAEs) and Treatment-Emergent Serious Adverse Events (TESAEs)

End point title	Number of Participants With Treatment-Emergent Adverse Events (TEAEs) and Treatment-Emergent Serious Adverse Events (TESAEs)
-----------------	--

End point description:

An adverse event (AE) was any untoward medical occurrence in a participant who received study drug without regard to possibility of causal relationship. An SAE was an AE resulting in any of the following outcomes or deemed significant for any other reason: death; initial or prolonged inpatient hospitalization; life-threatening experience (immediate risk of dying); persistent or significant disability/incapacity; congenital anomaly. Treatment-emergent are events between first dose of study drug and Day 169 that were absent before treatment or that worsened relative to pretreatment state. TEAE and TESAE were reported as per relatedness and severity. The safety population included all participants who received any amount of study medication.

End point title	Number of Participants With Pulmonary Function Test Values Below Threshold Values Based on Percent Change From Baseline at Day 85 and 169
-----------------	---

End point description:

Pulmonary function testing were performed by spirometry to assess forced expiratory volume in 1 second (FEV1), in 6 second (FEV6), forced vital capacity (FVC), and diffusing capacity for carbon monoxide (DLCO). FEV1 was maximal volume of air exhaled in first second of a forced expiration from a position of full inspiration. FVC was the volume of air which can be forcibly exhaled from the lungs after taking the deepest breath possible. DLCO is a pulmonary function test that measures the partial pressure difference between inspired and expired carbon monoxide. The percentage of predicted values of these pulmonary function tests were calculated based on decreases from baseline and categorized as more than (>) 20% reduction (RD) and absolute value (AV) less than (<) 80% predicted (PR). The safety population included all participants who received any amount of investigational product.

Secondary: Change From Baseline in Disease Activity Score of 28 Joints Using C-Reactive Protein (DAS28 [CRP]) Score at Day 169

End point title	Change From Baseline in Disease Activity Score of 28 Joints Using C-Reactive Protein (DAS28 [CRP]) Score at Day 169
-----------------	---

End point description:

DAS28 (CRP) calculated swollen joint count (SJC) and tender joint count (TJC) using the 28 joints, general health (GH) using participant assessment of disease activity (participant rated arthritis activity using the numerical rating scale with 0 = best, 10 = worst), and CRP (milligram per liter [mg/L]). Total score range: 0-9.4, higher score= more disease activity. DAS28 (CRP) less than (<) 3.2 = low disease activity, greater than or equal to (\geq) 3.2 to 5.1 = moderate to high disease activity and ≥ 5.2 = remission. The mITT population analysis set included all participants in the treatment group corresponding to their randomized treatment group. Here "n" signifies participants who were evaluable for this measure for the specified threshold value mentioned parameter for each arm, respectively.

Secondary: Change From Baseline in Continuous American College of Rheumatology (ACRn) Score at Day 169

End point title	Change From Baseline in Continuous American College of Rheumatology (ACRn) Score at Day 169
-----------------	---

End point description:

ACR score - continuous (ACRn) was defined as the minimum of the percentage improvement in TJC, SJC and the median of the percentage improvements in the other five components of the ACR criteria (participant assessment of pain; participant global assessment of disease activity; physician global assessment of disease activity; disability index of the HAQ; and CRP). Total score range was -100 to 100, where negative numbers indicated worsening and positive numbers indicated improvement. Mean indicates adjusted mean (Adj mean). The mITT population analysis set included all participants in the treatment group corresponding to their randomized treatment group. Here "n" signifies participants who were evaluable for this measure for the specified time point for each arm, respectively.

End point description:

HAQ-DI: participant-reported assessment of ability to perform tasks in 8 categories of daily living activities: dress/groom; arise; eat; walk; reach; grip; hygiene; and common activities over past week. Each item was scored on 4-point scale from 0 to 3: 0=no difficulty; 1=some difficulty; 2=much

difficulty; 3=unable to do. Overall score was computed as the sum of domain scores and divided by the number of domains answered. Total possible score range from 0 to 3; where 0 = least difficulty and 3 = extreme difficulty. The mITT population analysis set included all participants in the treatment group corresponding to their randomized treatment group. Here "n" signifies participants who were evaluable for this measure for the specified time point for each arm, respectively

End point type	Secondary
End point timeframe:	
Baseline and Day 169	

End point values	Golimumab 50 mg alternating with Placebo	Mavrilimumab 100 mg		
Subject group type	Reporting group	Reporting group		
Number of subjects analysed	68	70		
Units: units on a scale				
arithmetic mean (standard error)				
Baseline (n=68, 70)	1.58 (± 0.063)	1.59 (± 0.07)		
Change at Day 169 (n=64, 64)	-0.59 (± 0.081)	-0.4 (± 0.078)		

Statistical analyses

Statistical analysis title	Statistical analysis 1
----------------------------	------------------------

Statistical analysis description:

Analysis reported for Mean Change from Baseline in Health Assessment Questionnaire Disability Index (HAQ-DI) Score at Day 169. An estimate of the treatment difference and its 90% CI was computed by means of repeated measures model, adjusted for baseline and including terms for treatment group, visit and treatment by visit interaction.

Comparison groups	Mavrilimumab 100 mg v Golimumab 50 mg alternating with Placebo
Number of subjects included in analysis	138
Analysis specification	Pre-specified
Analysis type	other
P-value	= 0.055
Method	Repeated measures model
Parameter estimate	Adjusted mean difference
Point estimate	0.18
Confidence interval	
level	90 %
sides	2-sided
lower limit	0.03
upper limit	0.34

Secondary: Ratio of Change C-Reactive Protein (CRP) at Day 169 to Baseline

End point title	Ratio of Change C-Reactive Protein (CRP) at Day 169 to Baseline
-----------------	---

End point description:

The ratio of change from baseline for CRP was analyzed and reported. The CRP is a substance produced by the liver that increases in the presence of inflammation in the body. The test for CRP is a laboratory measurement for evaluation of an acute phase reactant of inflammation through the use of an ultrasensitive assay. A decrease in the level of CRP indicates reduction in inflammation and therefore improvement in underlying disease. The mITT population analysis set included all participants in the treatment group corresponding to their randomized treatment group. Here "N" (Number of participants analyzed) signifies those participants who were evaluable for this measure.

upper limit	1.41

Secondary: Erythrocyte Sedimentation Rate (ESR) at Day 169

End point title	Erythrocyte Sedimentation Rate (ESR) at Day 169
End point description:	
ESR is a laboratory test that provides a non-specific measure of inflammation. The test assesses the rate at which red blood cells fall in a test tube. The farther the red blood cells have descended, the greater the inflammatory response. The mITT population analysis set included all participants in the treatment group corresponding to their randomized treatment group. Here "N" (Number of participants analyzed) signifies those participants who were evaluable for this measure. "n" signifies participants evaluable for specified category for each arm, respectively.	
End point type	Secondary

Secondary: Serum Concentrations of Mavrimumab

End point title	Serum Concentrations of Mavrimumab ^[7]
End point description:	
Serum concentrations after subcutaneous dose of mavrimumab were calculated. The pharmacokinetic	

(PK) population included all participants who received mavrilimumab and for whom serum concentrations of mavrilimumab were available for PK data analyses. Here "n" signifies participants who were evaluable for the specified time point for each this arm respectively.

End point type	Secondary
End point timeframe:	
Baseline, Day 8, 15, 29, 85, 141, and 169	

Notes:

[7] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period. Justification: This end-point was related to only serum concentrations after subcutaneous dose of mavrilimumab and hence, not reporting statistics for all the arms in the baseline period.

End point values	Mavrilimumab 100 mg

Reporting groups

Reporting group title	Mavrilimumab 100 mg
-----------------------	---------------------

Reporting group description:

Participants received mavrilimumab 100 mg injection subcutaneously every 2 weeks for 24 weeks in combination with stable dose of methotrexate (7.5 to 25 mg per week) through oral or parenteral route.

Reporting group title	Golimumab 50 mg alternating with Placebo
-----------------------	--

Reporting group description:

Participants received alternating doses of golimumab 50 mg (Weeks 0, 4, 8, 12, 16, 20, and 24) and placebo matched to mavrilimumab (Weeks 2, 6, 10, 14, 18, and 22) injections subcutaneously every 2 weeks for 24 weeks in combination with stable dose of methotrexate (7.5 to 25 mg per week) through oral or parenteral route.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
10 December 2012	The maximum duration of the study was corrected from 40 weeks to 44 weeks. A diffusing capacity for carbon monoxide (DLCO) assessment was added to the protocol. The need for a sample collection for anti-drug antibodies (ADA) analysis in the event of a severe hypersensitivity reaction was removed from the protocol. A section describing un-blinding in the event of a suspected unexpected serious adverse reaction (SUSAR) was added to the protocol. Reference to the data safety monitoring board (DSMB) was removed from the Study-stopping Criteria section of the protocol. In the case of a clinically significant pulmonary abnormality, the language in the protocol was clarified to make it clear that the investigator was the responsible person, in collaboration with the sponsor, to make the decision to resume administration of investigational product. Exploratory end-point for the evaluation of flow cytometry was removed. Clarification for tuberculosis (TB) test was given if result of the QuantiFERON-TB Gold Test was indeterminate.
06 February 2013	Forced expiratory volume in 6 seconds (FEV6) assessment was added.
13 June 2013	Clinical study population was broadened to include subjects with an inadequate response to one or more conventional disease-modifying anti-rheumatic drugs (DMARDs) and anti- tumor necrosis factor (TNF) agents, clarification of forced vital capacity (FVC) was given as part of the diffusing capacity for carbon monoxide (DLCO) assessment.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

Non-compartmental analyses was not performed for pharmacokinetics parameters due to limited sampling schedule.

Notes:
