Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	28 July 2015
Is this the analysis of the primary completion data?	Yes
Primary completion date	28 July 2015
Global end of trial reached?	Yes
Global end of trial date	28 July 2015
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The purpose of this study is to evaluate the efficacy, safety and tolerability of adding 125 mg or 250 mg doses of MK-7655 (relebactam) to imipenem/cilastatin in adults 18 years or older with complicated urinary tract infection (cUTI). The primary hypothesis is that the relebactam + imipenem/cilastatin treatment regimen is non-inferior to imipenem/cilastatin with respect to the proportion of participants with a favorable microbiological response at completion of intravenous (IV) study therapy.

Protection of trial subjects:

This study was conducted in conformance with Good Clinical Practice standards and applicable country and/or local statutes and regulations regarding ethical committee review, informed consent, and the protection of human subjects participating in biomedical research.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	16 May 2012
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Bulgaria: 54
Country: Number of subjects enrolled	Greece: 3
Country: Number of subjects enrolled	Latvia: 46
Country: Number of subjects enrolled	Peru: 21
Country: Number of subjects enrolled	Poland: 14
Country: Number of subjects enrolled	Romania: 63
Country: Number of subjects enrolled	Russian Federation: 6
Country: Number of subjects enrolled	Korea, Republic of: 5
Country: Number of subjects enrolled	Turkey: 27
Country: Number of subjects enrolled	Ukraine: 59
Country: Number of subjects enrolled	United States: 4
Worldwide total number of subjects	302
EEA total number of subjects	180

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	180
From 65 to 84 years	117
85 years and over	5

Subject disposition

Recruitment

Recruitment details: -

Pre-assignment

Screening details:

Participants were enrolled with complicated urinary tract infection (cUTI) or acute pyelonephritis judged by the investigator to be serious (requiring hospitalization and intravenous (IV) antibiotic therapy); pyuria; and 1 positive urine culture within 48 hours of enrollment.

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Monitor, Data analyst

Arms

Are arms mutually exclusive?	Yes
Arm title	Relebactam 250 mg with imipenem/cilastatin

Arm description:

Relebactam 250 mg IV co-administered with 500 mg of imipenem/cilastatin once every 6 hours for a minimum of 96 hours. After 96 hours of IV treatment, participants may be switched to 500 mg ciprofloxacin (as optional oral therapy following minimum duration of IV study drug), administered orally, twice daily for the remainder of the study. Antibiotic therapy (IV and oral combined) should not exceed 14 days.

Arm type	Experimental
Investigational medicinal product name	Relebactam 250 mg
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

Relebactam 250 mg IV co-administered with imipenem/cilastatin 500 mg IV every 6 hours for a minimum of 96 hours

Investigational medicinal product name	imipenem/cilastatin 500 mg
Investigational medicinal product code	
Other name	PRIMAXIN®, TIENAM®
Pharmaceutical forms	Powder for solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

Relebactam 250 mg IV co-administered with imipenem/cilastatin 500 mg IV every 6 hours for a minimum of 96 hours

Investigational medicinal product name	Ciprofloxacin 500 mg
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

500 mg of Ciprofloxacin (as optional oral therapy following minimum duration of IV study drug) twice a day

Arm title	Relebactam 125 mg with imipenem/cilastatin
------------------	--

Arm description:

Relebactam 125 mg IV co-administered with 500 mg of imipenem/cilastatin once every 6 hours for a minimum of 96 hours. After 96 hours of IV treatment, participants may be switched to 500 mg ciprofloxacin (as optional oral therapy following minimum duration of IV study drug), administered orally, twice daily for the remainder of the study. Antibiotic therapy (IV and oral combined) should not exceed 14 days.

Arm type	Experimental
Investigational medicinal product name	imipenem/cilastatin 500 mg
Investigational medicinal product code	
Other name	PRIMAXIN®, TIENAM®
Pharmaceutical forms	Powder for solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

Relebactam 125 mg IV co-administered with imipenem/cilastatin 500 mg IV every 6 hours for a minimum of 96 hours

Investigational medicinal product name	Relebactam 125 mg
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

Relebactam 125 mg IV co-administered with imipenem/cilastatin 500 mg IV every 6 hours for a minimum of 96 hours

Investigational medicinal product name	Ciprofloxacin 500 mg
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

500 mg of Ciprofloxacin (as optional oral therapy following minimum duration of IV study drug) twice a day

Arm title	Placebo for relebactam with imipenem/cilastatin
------------------	---

Arm description:

Matching placebo for relebactam (0.9% normal saline) IV co-administered with 500 mg dose of imipenem/cilastatin once every 6 hours for a minimum of 96 hours. After 96 hours of IV treatment, participants may be switched to 500 mg ciprofloxacin (as optional oral therapy following minimum duration of IV study drug), administered orally, twice daily for the remainder of the study. Antibiotic therapy (IV and oral combined) should not exceed 14 days.

Arm type	Placebo
Investigational medicinal product name	imipenem/cilastatin 500 mg
Investigational medicinal product code	
Other name	PRIMAXIN®, TIENAM®
Pharmaceutical forms	Powder for solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

Matching placebo for relebactam IV co-administered with imipenem/cilastatin 500 mg IV every 6 hours for a minimum of 96 hours

Investigational medicinal product name	Matching placebo for relebactam
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

Matching placebo for relebactam IV co-administered with imipenem/cilastatin 500 mg IV every 6 hours for a minimum of 96 hours

Investigational medicinal product name	Ciprofloxacin 500 mg
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

500 mg of Ciprofloxacin (as optional oral therapy following minimum duration of IV study drug) twice a day

Antibiotic therapy (IV and oral combined) should not exceed 14 days.	

Primary: Percentage of Participants with a Favorable Microbiological Response at Completion of IV Study Therapy

End point title	Percentage of Participants with a Favorable Microbiological Response at Completion of IV Study Therapy
End point description: Microbiological response (MR) was assessed based on results of bacterial cultures obtained at completion of IV study medication relative to cultures obtained at baseline. A favorable microbiological response was defined as eradication of all pathogens identified at baseline. Microbiological response was assessed separately for each participant and pathogen identified in the Microbiologically Evaluable (ME) population that included participants with a urine culture confirmed to be positive for at least 1 gram-negative and/or anaerobic pathogen(s) commonly isolated in UTI. The overall microbiological response was determined as "favorable" if all pathogens isolated from a participant at baseline demonstrated a "favorable" response (eradication) at the time point evaluated. The analysis included all participants in the ME population with non-missing/non-indeterminate response.	
End point type	Primary
End point timeframe: At time of last dose of IV study medication (up to post-randomization day 14)

An AE could therefore be any unfavorable and unintended sign, symptom, or disease temporally associated with the use of a medicinal product/protocol-specified procedure, whether or not considered related to the medicinal product/protocol-specified procedure. Any worsening of a preexisting condition temporally associated with the use of the product was also an AE. A drug-related AE was defined as any untoward medical occurrence in a participant administered a pharmaceutical product that the investigator determined to be possibly, probably, or definitely related to the treatment. The population analyzed was all randomized participants who received ≥1 dose of study treatment.

Secondary: Percentage of Participants with a Favorable Microbiological Response at Completion of IV Study Therapy Who Have Imipenem-resistant, Gram-negative cUTI Infections

End point title	Percentage of Participants with a Favorable Microbiological Response at Completion of IV Study Therapy Who Have Imipenem-resistant, Gram-negative cUTI Infections
-----------------	---

End point description:

Microbiological response was assessed based on results of bacterial cultures obtained at completion of IV study medication relative to cultures obtained at baseline. A favorable microbiological response was defined as eradication of all pathogens identified at baseline. Microbiological response was assessed separately for each participant and pathogen identified in the Microbiologically Evaluable (ME) population that included participants with a urine culture confirmed to be positive for imipenem-resistant gram-negative or anaerobic infections at baseline. The overall microbiological response was determined as "favorable" if all pathogens isolated from a participant at baseline demonstrated a "favorable" response (eradication) at the time point evaluated. The analysis included all participants in the ME population with imipenem-resistant gram-negative infections at baseline.

occurrences (all)	4	5	6

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
25 October 2012	Protocol Amendment 3 modified the initial inclusion criterion that allowed for inclusion of patients in the study with risk factors for infection with an antibacterial-resistant organism. Additional risk factors for inclusion of these patients were added in this amendment.
13 May 2014	Protocol Amendment 5 removed the inclusion criteria that allowed for participants in the study based on at least one of three risk factors for infection with an antibacterial-resistant organism.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
