Notes:

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	Yes
EMA paediatric investigation plan number(s)	EMA-001823-PIP01-15
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	24 May 2023
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	28 February 2023
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

Objectives of the final analysis: 60 months efficacy and safety of the matrix-associated autologous chondrocyte implantation product NOVOCART 3D plus (N3D plus) in comparison to microfracture (MFx) for the treatment of cartilage defects of the knee (defect size 2 - 6 cm²).

Primary Objective: To demonstrate superiority of N3D plus versus MFx based on the IKDC subjective score improvement from baseline to the score measured at the 24-months post treatment.

Secondary objectives: Assessment of several efficacy variables for all follow-up time points until 60 months: change of IKDC subjective score and IKDC objective physician score, change of overall KOOS and KOOS subscores, KOOS and IKDC responder rates, MOCART MRI score, change of SF-36 score, proportion of treatment failures, safety variables

Protection of trial subjects:

Allowed concomitant medications: Outside the time windows specified in the trial protocol (washout, 2 weeks post MFx/N3D plus transplantation) normal standard of care should be followed. All concomitant medications were to be documented.

Regular follow-up visits were performed to monitor efficacy and safety after treatment. All adverse events were to be documented.

Regular on-site monitoring as well as several quality-assurance audits by TETEC AG or its designees were performed.

Safety data were reviewed by TETEC AG/the medical monitor and an external Clinical Safety Board on a regular basis.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	02 May 2013
Long term follow-up planned	Yes
Long term follow-up rationale	Efficacy, Safety
Long term follow-up duration	60 Months
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Switzerland: 3
Country: Number of subjects enrolled	Poland: 40
Country: Number of subjects enrolled	United Kingdom: 5
Country: Number of subjects enrolled	Austria: 2
Country: Number of subjects enrolled	Czechia: 47
Country: Number of subjects enrolled	France: 32
Country: Number of subjects enrolled	Germany: 31
Country: Number of subjects enrolled	Hungary: 27
Country: Number of subjects enrolled	Latvia: 7

Country: Number of subjects enrolled	Lithuania: 69
Worldwide total number of subjects	263
EEA total number of subjects	255

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	2
Adults (18-64 years)	261
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

Patients were enrolled and treated between May 2013 and February 2018 at 35 clinical sites in 10 European countries.

Pre-assignment

Screening details:

All patients with cartilage defects consulting the investigator during the recruitment phase of this clinical trial were informed of the trial. Patients who were interested in study participation, and had read the Patient Information and signed and dated the Patient Informed Consent form, were screened for eligibility (348 patients screened).

Pre-assignment period milestones

Number of subjects started	263
Number of subjects completed	263

Period 1

Period 1 title	Treatment and follow-up period (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	N3D group

Arm description:

Autologous chondrocyte implantation with NOVOCART 3D plus

Arm type	Experimental
Investigational medicinal product name	NOVOCART 3D plus
Investigational medicinal product code	M09AX02 (ATC code)
Other name	
Pharmaceutical forms	Implant, Implantation matrix
Routes of administration	Implantation, Intraarticular use, Intralesional use, Local use

Dosage and administration details:

The product NOVOCART® 3D plus contains a total of 8.25 - 44 x 10⁶ articular chondrocytes as active substance, seeded on a biphasic bioresorbable collagen-based scaffold (matrix) of bovine origin consisting of a membrane cover and a cell-carrying porous sponge lying underneath. Matrix-associated chondrocyte implantation (M-ACI) treatment with NOVOCART® 3D plus requires 2 surgeries. During arthroscopy small cartilage biopsies are taken from a non-weight bearing area of the knee and sent to TETEC AG for NOVOCART® 3D plus transplant production. About 3 to 4 weeks later, the transplantation takes place in a second surgery. NOVOCART® 3D plus is implanted via a minimally invasive approach (mini-arthrotomy). The cell-seeded matrix is cut or punched intraoperatively by the surgeon to fit the defect size and shape. The transplant is sutured into the defect area with absorbable suture material applied in simple interrupted sutures or fixed with absorbable minipins.

Arm title	Microfracture
-----------	---------------

Arm description:

Microfracture

Arm type	Active comparator
----------	-------------------

Investigational medicinal product name	No IMP assigned in this arm
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Not assigned
Routes of administration	Intraarticular use

Dosage and administration details:

During microfracturing, the defect is cleansed from diseased or destroyed cartilage tissue down to the subchondral bone plate (debridement). Defect rims have to be debrided into the healthy cartilage tissue. An instrument set of two different angled microfracture picks (20° and 40°) is provided by TETEC AG to perform the microfracture procedure. The exposed bone plate is then perforated preferably by one of these picks until focal bleeding occurs or fat droplets appear. In order to avoid a fracture of the bone plate, the perforation distances should exceed 3-4 mm (Steadman et al., 1999).

Number of subjects in period 1	N3D group	Microfracture
Started	178	85
Completed	158	72
Not completed	20	13
Consent withdrawn by subject	3	4
Adverse event, non-fatal	1	-
Not specified	9	2
Lost to follow-up	7	7

Primary: IKDC subjective score change from baseline (24 mo)

End point title	IKDC subjective score change from baseline (24 mo)
End point description: The IKDC subjective score is an established, knee-specific, patient-reported outcome measure. The questionnaire covers 3 separate categories: "symptoms" (7 questions), "sports activity" (2 questions), and "current knee function" (1 question). The IKDC subjective total transformed score has a span from 0 to 100, with higher values indicating higher levels of function and lower levels of symptoms. Data for 24 months follow-up (primary endpoint, main analysis) is reported here.	
End point type	Primary
End point timeframe: 24 months

level	95.48 %
sides	2-sided
lower limit	-4.17
upper limit	6.21

Secondary: Change from baseline in IKDC objective score (60 mo)

End point title	Change from baseline in IKDC objective score (60 mo)
-----------------	--

End point description:

The IKDC objective score is performed by the investigator to evaluate a variety of knee conditions including ligament, meniscal, articular cartilage, arthritis, and patellofemoral injuries. The assessment consists of a functional assessment of the knee (range of motion, rotation, crepitation), as well as instrumental and/or imaging-based evaluation of the different compartments.

The form contains items that fall into one of 7 measurement domains. The 7 domains assessed by the knee examination form are:

1. Effusion
2. Passive Motion Deficit
3. Ligament Examination
4. Compartment Findings
5. Harvest Site Pathology
6. X-ray Findings
7. Functional Test

Each item is evaluated using a 4-grade classification into "normal", "nearly normal", "abnormal", and "severely abnormal". For the current analysis only the first 3 domains were considered and analyzed categorically.

Here the results after 60 months follow-up are presented.

Secondary: Overall Knee Injury and Osteoarthritis Outcome Score (KOOS) change from baseline

End point title	Overall Knee Injury and Osteoarthritis Outcome Score (KOOS) change from baseline
-----------------	--

End point description:

The KOOS has been developed as an instrument to assess the patients' opinion about their knee and associated problems. The KOOS consists of 5 subscales; pain, other symptoms, function in daily living (ADL), function in sport and recreation (sport/rec) and knee-related quality of life QoL. The last week is taken into consideration when answering the questions. Standardized answer options are given (5 Likert boxes) and each question gets a score from 0 to 4. A normalized score (100 indicating no symptoms and 0 indicating extreme symptoms) is calculated for each subscale. In addition, the overall KOOS score, defined as the average of the 5 subscale scores (ensuring equal weighting of all subscales), can be calculated.

Data for 60 months follow-up is reported here. The statistical analysis at 24 and 60 months is provided in the attachment.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
03 September 2012	<ul style="list-style-type: none">• Slight changes in inclusion criteria to avoid contradictions to exclusion criteria;• Details on consequences of patients requiring subsequent surgery were added (patients with subsequent surgery were allowed to remain in the study);• Specifications on confirmatory hypothesis tests of secondary efficacy endpoints were added;• An additional MRI assessment was scheduled for the screening visits (to assess eligibility criteria).
25 July 2013	<ul style="list-style-type: none">• Participating countries were updated (France, Poland, Netherlands, Czech Republic);• Inclusion criterion No. 2 was generalized from "patient has symptomatic knee pain indicative of articular cartilage defects of the knee unsuccessfully treated with conservative care (e.g., analgesics, rest, and physical therapy)" to the current wording: "Patient has a localized articular cartilage defect of the femoral condyle or the trochlea of the knee. 2 localized cartilage defects are accepted if the total defect size is ≤ 6 cm², both cartilage defects are located at the femoral condyle and/or the trochlea and both cartilage defects are to be treated with NOVOCART® 3D plus or microfracture.";• The allowed defect size was extended from "≥ 3 and ≤ 5 cm²" to "≥ 2 and ≤ 6 cm² post debridement";• The maximum allowed meniscus resection was extended from 33% to 50%;• The exclusion criterion "patient has had prior release and excision of scar tissue except isolated lateral release in the target knee." was deleted, as this criterion would have created an artificial situation;• A couple of exclusion criteria were deleted, as their clinical relevance and impact on study results was not evident. However, the exclusion criterion concerning prior surgical treatments of clinical relevance in the target knee was added instead;• The excluded use of steroids within the past 3 months prior to screening was limited to systemic or intraarticular steroids within 30 days prior to tissue harvest/MFx;• Low-dose treatment with NSAIDs (not capable of pain relief) was allowed;• The accepted BMI was increased from 30 kg/m² to 35 kg/m²;

16 November 2015	<ul style="list-style-type: none"> • Based on supporting literature data showing the full evolvement of the beneficial treatment effects of MACT and MFx already after 24 months post-surgery, it was decided to prepone the time point for the primary efficacy analyses from 36 months to 24 months post-treatment. • A definition for treatment failure was included and the proportion of treatment failures was added as a secondary endpoint; • The originally planned patient number for the MRI sub-study (64 in each arm) was adapted to match the actual randomization ratio of 2:1 • Biomarker sampling (blood and urine) was limited from all patients to a subset of patients from pre-selected sites; • The screening period (which was previously unlimited in time) was restricted to a maximum of 3 months from screening visit 1 to visit 2 (arthroscopy); • Clarifications and slight changes in in- and exclusion criteria, e.g., clarification that, if 2 localized defects have to be treated, the size of each individual lesion had to be ≥ 2 cm²; permission to include patients with known history of diabetes, primary hyperparathyroidism or hyperthyroidism, provided these conditions were sufficiently controlled; the exclusion criterion "known history of cancer" was limited to the past 5 years; in the original protocol, patients taking indomethacin or other NSAIDs were not to be included into the study. This exclusion criterion was deleted and the concomitant medication section was revised accordingly to cover washout periods; • For unscheduled visits, the IKDC objective physician score, physical examination and vital signs, SF-36, KOOS, IKDC subjective score, activity level and functional status were added as mandatory assessments; • The post-treatment rehabilitation regimen according to Hirschmüller et al. was changed from a mandatory to an optional (although still recommended) procedure. Still, patients were to undergo post-treatment rehabilitation according to the standard of care in the respective site/country at least
05 October 2016	<ul style="list-style-type: none"> • In the context of the "Pediatric Investigational Plan" (PIP) discussions, the Pediatric Committee (PDCO) requested prospective data on the efficacy and safety of NOVOCART® 3D in skeletally mature pediatric patients. As suggested by the PDCO, the protocol was amended to include pediatric patients with closed epiphyseal growth plates. The inclusion criteria were expanded accordingly and the statistical section updated to include the subgroup analyses; • The definition of treatment failures was amended to make clear that only graft/MFx-related conditions requiring surgical re-intervention should be considered treatment failures (in the previous definition the relatedness was missing); • Latvia, Lithuania, Hungary, and Turkey were added as participating countries to the study; • HTLV-I antibody testing was introduced for all patients living in, or originating from, high-prevalence areas, or with sexual partners originating from those areas, or where the patient's parents originated from those areas; • Cryopreservation was explicitly allowed as an exception in the event that the originally agreed transplantation date had to be postponed; • It was added that patients in the MFx arm receiving other subsequent treatments on the target lesion (e.g., other ACT, total knee replacement etc.) were to be withdrawn from the study, whereas patients in the N3D arm were to remain in the study (but only adverse events related to NOVOCART® 3D plus treatment and serious adverse events (irrespective of relationship) were to be collected in these patients after change in therapy);

11 September 2018	<ul style="list-style-type: none"> • The group of "further exploratory endpoints" (i.e., KOOS total responder rate, IKDC responder rate, rate of surgical re-intervention on the target knee) was added to the set of efficacy analyses; • A second definition of treatment failure (definition No. 2) was introduced to the effect that surgical re-interventions not affecting the closed surface of the transplant / microfracture area were not automatically classified as treatment failure; • Advanced T2 mapping analyses using GLCM features were added to the MRI analyses, since these features serve as a robust quantitative marker for collagen fiber organization; • The length of incision was omitted as key secondary endpoint (because this variable is recorded only in the N3D group); • Following an EMA recommendation, the IUDR procedure was used as replacement strategy for missing values in the primary and key secondary analyses. The linear mixed effect model for repeated measurements (MMRM) without imputation of missing values was implemented as a sensitivity analysis. The imputation of missing values due to treatment failure by "last observation carried forward (LOCF)" was omitted; • The nominal significance levels at the interim and main (final) analysis were fixed in order to ensure independency from the actual information available after the interim analysis (as recommended by the EMA); • A supplementary NI analysis was implemented in the case of a failed superiority test of NOVOCART® 3D plus vs. microfracture.
-------------------	---

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
