

**Clinical Development  
Picotamide in the Prophylaxis of Migraine with Aura  
Clinical Study Report**

**Study No: 19122011**

**EudraCT No.: 2011-006207-36**

**A multi centre, double blind, randomised, placebo controlled crossover study to evaluate the efficacy and tolerability of picotamide in the prophylaxis of migraine in patients presenting with migraine with aura**

**Document type:** Clinical Study Report

**Development phase:** Phase II      **Protocol No.:** 19122011

**First subject enrolled:** July 11, 2012      **Last subject completed:** October 12, 2016

**Principal investigator:** Prof. Jes Olesen, M.D., Danish Head Center,  
Department of Neurology, Glostrup Hospital,  
DK-2600 Glostrup, Denmark

**Coordinating and Responsible Study Manager**      Günter Graubach, Proreo Pharma Innovation AG,  
Weierweg 7, CH-4410 Liestal, Switzerland

**Sponsor signatory**      Proreo Pharma Innovation AG, Weierweg 7, CH-4410 Liestal,  
Switzerland

**Document status:** Final Version 1.0      Release date: June 06, 2018

## 2. SYNOPSIS

<b>Name of Sponsor/Company:</b> <b>Proreo Pharma Innovation AG</b>		
<i>Name of Finished Product:</i> <b>Plactidil</b>		
<i>Name of Active Ingredient:</i> <b>Picotamide</b>		
<b>Title of Study:</b> <b>A multi centre, double blind, randomised, placebo controlled crossover study to evaluate the efficacy and tolerability of picotamide in the prophylaxis of migraine in patients presenting with migraine with aura.</b>		
<b>Investigator:</b> Prof. Jes Olesen, M.D.		
<b>Study centre:</b> Danish Headache Center, Department of Neurology, Glostrup Hospital, DK-2600 Glostrup, Denmark		
<b>Publication (reference):</b> None		
<b>Study period (years):</b> (date of first enrolment) (date of last completed)	4 July 11, 2012 October 12, 2016	Phase of development: II
<b>Objectives:</b> <i>Primary objective:</i> <ul style="list-style-type: none"> <li>To investigate the efficacy of picotamide compared to placebo in the reduction of the number of auras in patients with migraine with aura.</li> </ul> <i>Secondary objectives:</i> <ol style="list-style-type: none"> <li>To compare the safety and tolerability of picotamide and placebo in the prophylactic treatment of patients with migraine with aura;</li> <li>To investigate the efficacy of picotamide compared to placebo on the number and overall severity of migraine attacks experienced during a three-month treatment period together with associated symptoms.</li> </ol>		
<b>Methodology:</b> Double-blind, placebo-controlled efficacy and safety study using a cross-over design.		
Number of subjects (planned and analyzed): Sixty-two (62) patients with migraine with aura.		
Diagnosis and main criteria for inclusion: Male and female patients with migraine with aura between 18 and 65 years old.		
Test product, dose and mode of administration, batch number: <ul style="list-style-type: none"> <li>Plactidil tablets containing 300 mg picotamide (batch no: 1102 (2012), F003Y (2015))</li> </ul> The study medication was given orally twice daily		
Reference therapy, dose and mode of administration, batch number: <ul style="list-style-type: none"> <li>Tablets containing placebo (batch no. D006W (2012), K037X (2015))</li> </ul> The study medication was given orally twice daily		
Duration of treatment: Plactidil: Twelve weeks oral administrations of the study medication. Placebo: Twelve weeks oral administrations of the study medication. Wash-out period of 4 weeks with placebo between treatment periods.		

<b>Name of Sponsor/Company:</b> <b>Proreo Pharma Innovation AG</b>		
<i>Name of Finished Product:</i> <b>Plactidil</b>		
<i>Name of Active Ingredient:</i> <b>Picotamide</b>		
Criteria for evaluation: Efficacy: <ul style="list-style-type: none"> <li>- Mean number of auras during each treatment period,</li> <li>- Mean number of migraine headache days in each treatment period,</li> <li>- Mean number of non-migraine related headache days in each treatment period</li> <li>- Mean number of auras followed by headache in each treatment period,</li> <li>- Mean number of headache days in each month of treatment in each treatment period,</li> <li>- Mean number of auras and/or migraine headache during each treatment period,</li> <li>- Mean number of migraine headache attacks in each treatment period,</li> <li>- Mean monthly consumption of rescue medication during the last month and the whole of each treatment period from the baseline period to Month 3,</li> <li>- Mean duration of auras in each treatment period,</li> <li>- Mean number of symptoms associated with auras in each treatment period,</li> <li>- Reduction in the number of auras and the number of migraine headache days relative to the placebo treatment period.</li> </ul>		
Safety: Incidence of all adverse events (AEs), serious AEs and AEs leading to withdrawal of trial medication, clinical laboratory tests, vital signs and physical examination.		
Efficacy: Not applicable.		
Statistical methods: Wilcoxon signed rank test on efficacy parameters. Individual data listings and, if appropriate, descriptive statistics on safety data.		
<b>Results:</b>		
Efficacy Results: <ul style="list-style-type: none"> <li>• Picotamide did not reduce the number of auras in patients with migraine with aura compared to placebo in a larger patient population with 1 or more MwA attacks.</li> <li>• Picotamide had no effect on the number and overall severity of migraine attacks experienced during a three-month treatment period together with associated symptoms compared to placebo in a larger patient population with 1 or more MwA attacks.</li> <li>• Post hoc analysis indicates: <ul style="list-style-type: none"> <li>○ Based on rationales (IHS guidelines and based on recent Phase II clinical studies in migraine), subsets of patients with 1 - 6 and 3 - 6 MwA attacks per month prior to the study were analyzed.</li> <li>○ When applying these selected inclusion criteria picotamide treatment was associated with a significant reduction of number of MwA attacks in comparison to placebo.</li> <li>○ Number of MwA attacks in pre-study, as selection criterion for a migraine study, has an impact on clinical outcome.</li> </ul> </li> <li>• Instead of a cross-over design with an inclusion criteria of &gt;1 MwA attacks per month, a parallel-group design with a solid run-in period with diary-controlled attack frequency as well as defining cut-offs (min-max) for number of MwA attacks per month may be more appropriate</li> </ul>		
Safety Results: <ul style="list-style-type: none"> <li>• Single and repeated oral doses of picotamide were well tolerated by the patients with migraine with aura;</li> <li>• Three serious adverse events were reported; they were not regarded as related to the study medication;</li> <li>• The majority of adverse events reported were mild. There were no differences in the incidence and the profile of the most relevant and frequent AEs between placebo and picotamide;</li> <li>• There are two events of accidental bleeding for which a relationship to picotamide treatment cannot be completely excluded.</li> </ul>		
<b>Date of the report: Juine 06, 2018</b>
