

Clinical trial results:

An open-label, randomized, three-parallel-group study on pharmacodynamic effects of 8-week QD treatment with lixisenatide compared to liraglutide in patients with type 2 diabetes not adequately controlled with insulin glargine with or without metformin

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	27 August 2013
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	25 July 2013
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

To investigate the effects of repeated subcutaneous (SC) doses of lixisenatide 20 microgram (mcg) once daily (QD) as compared to liraglutide 1.2 milligram (mg) QD or 1.8 mg QD in reducing post-prandial plasma glucose (PPG) assessed as area under the plasma glucose concentration- time curve (AUC) after a standardized breakfast at the end of an 8- week treatment period in subjects with type 2 diabetes mellitus (T2DM) not adequately controlled with insulin glargine (+/- metformin).

Protection of trial subjects:

Subjects were fully informed of all pertinent aspects of the clinical trial as well as the possibility to discontinue at any time in language and terms appropriate for the subject and considering the local culture. During the course of the trial, subjects were provided with individual subject cards indicating the nature of the trial the subject is participating, contact details and any information needed in the event of a medical emergency.

Collected personal data and human biological samples were processed in compliance with the Sanofi-Aventis Group Personal Data Protection Charter ensuring that the Group abides by the laws governing personal data protection in force in all countries in which it operates.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	22 May 2012
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Germany: 142
Worldwide total number of subjects	142
EEA total number of subjects	142

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0

Adolescents (12-17 years)	0
Adults (18-64 years)	86
From 65 to 84 years	56
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

The study was conducted at 8 centres in Germany between 22 May 2012 to 25 July 2013.

Pre-assignment

Screening details:

A total of 236 subjects were screened and 142 subjects were randomized and treated.

Period 1

Period 1 title	Overall study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
------------------------------	-----

Arm title	Lixisenatide 20 mcg
------------------	---------------------

Arm description:

Lixisenatide for 8 weeks (up to Day 57) and a maintenance dose of 20 mcg QD.

Arm type	Experimental
Investigational medicinal product name	Lixisenatide
Investigational medicinal product code	AVE0010
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Lixisenatide 10 mcg QD for 2 weeks followed by 20 mcg QD for 6 weeks (up to Day 57), to be self-administered with a pen-like injector (OptiClik®), under fasted conditions.

Arm title	Liraglutide 1.2 mg
------------------	--------------------

Arm description:

Liraglutide for 8 weeks (up to Day 57) and a maintenance dose of 1.2 mg QD.

Arm type	Active comparator
Investigational medicinal product name	Liraglutide
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Liraglutide 0.6 mg QD for 1 week followed by 1.2 mg QD for 7 weeks (up to Day 57), to be self-administered using a prefilled pen (Victoza®), under fasted conditions.

Arm title	Liraglutide 1.8 mg
------------------	--------------------

Arm description:

Liraglutide for 8 weeks (up to Day 57) and a maintenance dose of 1.8 mg QD.

Arm type	Active comparator
Investigational medicinal product name	Liraglutide
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Liraglutide 0.6 mg QD for 1 week followed by 1.2 mg QD for 1 week and then 1.8 QD mg for 6 weeks (up to Day 57), to be self-administered by using a prefilled pen (Victoza®) under fasted conditions.

Number of subjects in period 1	Lixisenatide 20 mcg	Liraglutide 1.2 mg	Liraglutide 1.8 mg

Primary: Change From Baseline to Day 56 in Plasma Glucose Corrected Area Under The Plasma Concentration-Time Curve (AUC) From Time 0.5 Hours to 4.5 Hours

End point title	Change From Baseline to Day 56 in Plasma Glucose Corrected Area Under The Plasma Concentration-Time Curve (AUC) From Time 0.5 Hours to 4.5 Hours
-----------------	--

End point description:

Plasma glucose was assessed using the Gluco-quant Glucose/hexokinase assay. The range of the method was 3 to 1000 milligram per decilitre (mg/dL) with 1 mg/dL as limit of detection (LOD). Calculation of the AUC was made on Day -3 (baseline) and on Day 56 using the linear trapezoidal rule from time of breakfast start (30 minutes after study drug administration [time: 0.5 hours]) to 4 hours after breakfast start (time: 4.5 hours) and corrected by subtracting pre-breakfast plasma glucose concentration (time: 0.5 hours). Analysis was carried out on pharmacodynamic (PD) population defined as all randomized subjects, who received at least one dose of lixisenatide 20 microgram (mcg), liraglutide 1.2 milligram (mg) or liraglutide 1.8 mg, and had both a baseline assessment and at least one post-baseline assessment of any primary or secondary PD variables.

End point type	Primary

Statistical analyses

Statistical analysis title	Lixisenatide vs Liraglutide 1.2 mg
----------------------------	------------------------------------

Statistical analysis description:

Analysis was performed using linear fixed effects model with treatment and stratification factors (HbA1c levels on Day -7 [$<8\%$ and $\geq 8\%$], use of metformin at screening [yes or no]) and the study site as

fixed effects and baseline plasma glucose AUC from 0.5 to 4.5 hours as covariate.

Comparison groups	Lixisenatide 20 mcg v Liraglutide 1.2 mg
Number of subjects included in analysis	89
Analysis specification	Pre-specified
Analysis type	superiority ^[1]
P-value	< 0.0001
Method	Linear fixed effects model
Parameter estimate	Least squares mean difference
Point estimate	-6.01
Confidence interval	
level	95 %
sides	1-sided
lower limit	-7.77
Variability estimate	Standard error of the mean
Dispersion value	1.06

Notes:

[1] - To address multiplicity issue and ensure overall 1-sided level of 5%, Hochberg method was used for testing procedure of comparison between lixisenatide vs liraglutide 1.2 mg or 1.8 mg. p-values were ordered ($p_1 \leq p_2$) and following rules were applied:

- 1)if $p_2 \leq 0.05$: lixisenatide was superior to liraglutide (both dose)
- 2)if $p_2 > 0.05$ and $p_1 \leq 0.025$: lixisenatide was superior to dose of liraglutide associated with p_1
- 3)if $p_2 > 0.05$ and $p_1 > 0.025$: no comparison was declared as statistically significant.

Statistical analysis title	Lixisenatide vs Liraglutide 1. 8 mg
-----------------------------------	-------------------------------------

Statistical analysis description:

Analysis was performed using linear mixed effects model with treatment and stratification factors (HbA1c levels on Day -7 [$<8\%$ and $\geq 8\%$], use of metformin at screening [yes or no]), and the study site as fixed effects and baseline plasma glucose AUC from 0.5 to 4.5 hours as covariate.

Secondary: Change From Baseline to Day 55 in Gastric Emptying Coefficient

End point title	Change From Baseline to Day 55 in Gastric Emptying Coefficient
-----------------	--

End point description:

Gastric emptying was measured using ¹³C-octanoic acid breath test by isotope-selective non-dispersive infrared spectrometry. Gastric emptying coefficient was derived from a mathematical formula that describes the gastric-emptying rate and gives an overall index of gastric emptying. Analysis was carried out on PD population.

Adverse events

Adverse events information

Timeframe for reporting adverse events:

All Adverse Events (AE) were collected from signature of the informed consent form up to the end of study regardless of seriousness or relationship to investigational product.

Adverse event reporting additional description:

Reported adverse events are treatment-emergent adverse events that developed/worsened during the 'on treatment period' (the time from the first drug injection [included] up to 3 days after the last injection of drug administration [included]).

Assessment type	Systematic

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
25 September 2012	<p>- Change in the Inclusion/Exclusion criteria: Subjects were eligible to enter in the screening phase with a stable dose of Neutral Protamine Hagedorn (NPH) or insulin glargine of at least 10 International units per day (IU/Day) (for at least 2 months prior to screening) instead of 20 units per day, alone or combined with a stable dose of metformin with or without Dipeptidyl peptidase (DPP)-IV inhibitor or sulfonylurea. Subjects receiving NPH or insulin glargine with metformin combined with DPP-IV inhibitors or sulfonylurea were eligible to enter in the screening phase provided that the run-in period will last 12 fixed weeks and subjects who received liraglutide 3 months prior to the time of screening were eligible. Inclusion of subjects who had received liraglutide provided that liraglutide treatment was stopped at least 3 months before the time of the screening for other reason than safety/tolerability issue or lack of efficacy.</p> <p>- Change in the run-in period: Either the run-in period was to be extended up to 12 weeks, if needed, in subjects treated with an initial therapy with NPH or insulin glargine of at least 10 IU/Day with or without metformin alone; or the run-in period was to be fixed to 12 weeks for subjects treated with an initial therapy with NPH or insulin glargine with metformin combined with DPP-4 inhibitor or sulfonylurea. This period was needed for reaching an appropriate baseline glycemic control after stopping DPP-4 inhibitor or sulfonylurea.</p> <p>- Change in the study/period flow charts and duration of participation: The changes in the run-in period with additional visits was to be included in the change in the study/period flow charts. The maximum duration of participation per subject was 23 weeks and one day +/- 2 days. Reporting timelines of SAE by the investigator have been changed from "within 1 working day" to "within 24 hours" following the European Commission (EC) guidance 2011/C 172/01 (dated 11 June 2011).</p>

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No
