Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	27 August 2014
Is this the analysis of the primary completion data?	Yes
Primary completion date	11 March 2014
Global end of trial reached?	Yes
Global end of trial date	11 March 2014
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

To confirm superiority of insulin degludec/liraglutide versus unchanged glucagon-like peptide-1 (GLP-1) receptor agonist therapy in controlling glycaemia in insulin naïve subjects with type 2 diabetes mellitus (T2DM) inadequately controlled on GLP-1 receptor agonist therapy in combination with metformin±pioglitazone±sulphonylurea.

Protection of trial subjects:

The trial was conducted in accordance with the Declaration of Helsinki (59th WMA Assembly, October 2008) and ICH Good Clinical Practice (May 1996) and 21 CFR 312.120.

Background therapy:

Subjects continued with the OADs Metformin, pioglitazone and sulphonylurea in stable pre-trial doses.

Evidence for comparator:

Not applicable.

Actual start date of recruitment	29 August 2012
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Australia: 41
Country: Number of subjects enrolled	United States: 262
Country: Number of subjects enrolled	Slovakia: 60
Country: Number of subjects enrolled	France: 40
Country: Number of subjects enrolled	Hungary: 35
Worldwide total number of subjects	438
EEA total number of subjects	135

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0

Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	326
From 65 to 84 years	112
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

The trial was conducted at 81 sites in 5 countries as follows: Australia: 5 sites; France: 7 sites; Hungary: 4 sites; Slovakia 6 sites; United States: 59 sites.

Pre-assignment

Screening details:

The duration of the screening period was 2-weeks. All subjects continued GLP-1 receptor agonist and metformin±pioglitazone±SU treatments in their pre-trial doses during the screening period.

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

Blinding implementation details:

Not applicable

Arms

Are arms mutually exclusive?	Yes
Arm title	Insulin degludec/liraglutide + OADs

Arm description:

Subjects were treated with subcutaneous (under the skin) once daily (OD) insulin degludec/liraglutide. Insulin degludec/liraglutide was dosed on an individual basis. Subjects also continued their pre-trial OADs (metformin±pioglitazone±SU) treatment without changing the frequency or dose throughout the trial, unless there was a safety concern.

Arm type	Experimental
Investigational medicinal product name	Insulin degludec/liraglutide PDS290
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Insulin degludec/liraglutide in a fixed insulin degludec/liraglutide ratio of 100 units/3.6 mg per mL was supplied in a 3 mL prefilled PDS290 pen-injector. Insulin degludec/liraglutide was injected s.c. in the thigh, upper arm (deltoid region) or abdomen once daily preferably at the same time every day. The insulin degludec/liraglutide dosing unit is defined as a dose step, where 1 insulin degludec/liraglutide dose step consists of 1 unit insulin degludec and 0.036 mg liraglutide. Treatment with insulin degludec/liraglutide was initiated at 16 dose steps containing 16 units insulin degludec and 0.6 mg liraglutide. Adjustment of the insulin degludec/liraglutide dose performed twice weekly based on the mean of 3 preceding daily fasting SMPG values on 3 consecutive days. The maximum allowed dose was 50 dose steps (50 units insulin degludec/1.8 mg liraglutide).

Arm title	Liraglutide or exenatide + OADs
------------------	---------------------------------

Arm description:

Subjects continued on their pre-trial treatment with subcutaneous (under the skin) liraglutide (Victoza®) (GLP-1 receptor agonist) or exenatide (Byetta®) (GLP-1 receptor agonist) without changing the frequency or dose throughout the trial. Subjects also continued their pre-trial OADs (metformin±pioglitazone±SU) without changing the frequency or dose throughout the trial, unless there was a safety concern.

Arm type	Active comparator
----------	-------------------

Investigational medicinal product name	Liraglutide or Exenatide
Investigational medicinal product code	
Other name	Victoza or Byetta
Pharmaceutical forms	Solution for injection
Routes of administration	Subcutaneous use

Dosage and administration details:

The subjects continued their pre-trial GLP-1 receptor agonist treatment either with liraglutide or exenatide with the dose and treatment schedule unchanged throughout the trial period. Subjects also continued with the OADs - metformin, pioglitazone and SU - in stable pre-trial doses (unless there was a safety concern).

Number of subjects in period 1	Insulin degludec/liraglutide + OADs	Liraglutide or exenatide + OADs
Started	292	146
Completed	276	117
Not completed	16	29
Adverse event, non-fatal	1	2
Other	4	10
Withdrawal criteria	2	14
Protocol deviation	9	3

Secondary: Number of treatment-emergent (confirmed) hypoglycaemic episodes.

End point title	Number of treatment-emergent (confirmed) hypoglycaemic episodes.
End point description:	
Rate (event rate per 100 patient years of exposure) of treatment-emergent confirmed hypoglycaemic episodes. The pool of severe and minor hypoglycaemic episodes was referred to as confirmed hypoglycaemic episodes.	
Severe hypoglycaemia was categorised as an episode requiring assistance of another person to actively administer carbohydrate, glucagon, or other resuscitative actions. Minor hypoglycaemic episodes were defined as an episode with symptoms consistent with hypoglycaemia with confirmation by blood glucose <2.8 mmol/L (50 mg/dL) or PG <3.1 mmol/L (56 mg/dL), and which was handled by the subject himself/herself, or any asymptomatic blood glucose value <2.8 mmol/L (50 mg/dL) or PG value <3.1 mmol/L (56 mg/dL).	
End point type	Secondary

Secondary: Change from baseline in patient reported outcomes (PROs):-Treatment related impact measure – diabetes (TRIM-D).

End point title	Change from baseline in patient reported outcomes (PROs):- Treatment related impact measure – diabetes (TRIM-D).
-----------------	---

End point description:

The mean change from baseline on the 'Treatment related impact measure for diabetes' (TRIM-D), after 26 weeks of treatment. A higher score on the 1–5 point TRIM-D scale indicates a better health state (less negative impact). The mean change in scores for all the sub domains (treatment burden, daily life, diabetes management, compliance and psychological health) and total scores were analysed. Sub-domain scores were calculated by summing across items in the same domain and total score was calculated by adding scores from all the domains.

End point type	Secondary
----------------	-----------

End point timeframe:

After 26 weeks of treatment.

End point values	Insulin degludec/liraglutide + OADs	Liraglutide or exenatide + OADs

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
04 February 2013	<p>The global amendment included:</p> <ul style="list-style-type: none">a) Changes in the pre-trial medication from GLP-1 and metformin therapy to allow GLP-1 in combination with OADs (metformin±pioglitazone±SU) due to recruitment facilitation and reflection of current diabetic patient population on GLP-1 receptor agonists.b) Changes to the endpoints and statistical sections as described in Section 9.8.2 of this CTR.c) Update of withdrawal criterion no. 1. Updates of the list of participating countries (Hungary added), recruitment timelines, blood volume to be drawn, protocol title, version and date of all appendices.d) Update of the following MESI's based on the learning's from previous insulin degludec/liraglutide trials:<ul style="list-style-type: none">– Acute coronary syndrome (myocardial infarction [MI] or hospitalisation for unstable angina), incl. AMI caused by stent thrombosis: The wording “, incl. AMI caused by stent thrombosis” was deleted, as this information was already provided under Definitions in Appendix D.– Hospitalisation for cardiac arrhythmia: The word “hospitalisation” was removed, as reporting of hospitalisation for cardiac arrhythmia was not always applicable. Cardiac arrhythmia was still to be reported as a MESI.– Elevated lipase and/or amylase: Confirmatory testing removed. The single elevation >3xUNR of lipase/amylase was to be reported as a MESI.– Elevated calcitonin: Protocol text clarified and aligned to match Appendix D of the protocol.e) Removal of the initial aim to recruit approximately 50% of each type of GLP-1 receptor agonist.f) Update of the ICF regarding blood to be drawn and increased heart rate according to the recent investigator's brochure for liraglutide.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

Not applicable

Notes:
