General information about the trial

Main objective of the trial:

Demonstrate the superiority of extended duration (35 days + 7 day window, i.e. 35-42 days allowed) anticoagulation with betrixaban as compared to the standard of care (10 ± 4 days) with enoxaparin for prevention of VTE in patients who are at risk due to acute medical illness

Protection of trial subjects:

The conduct of this clinical study met local legal and regulatory requirements. The study was conducted in accordance with the ethical principles that have their origin in the Declaration of Helsinki and the International Conference on Harmonization guideline E6: Good Clinical Practice. Before entering the study, the informed consent explained to all subjects and/or their legally authorized representative. Participating subjects and/or their legally authorized representative signed informed consent form and could withdraw from the study at any time. Only investigators qualified by training and experience were selected as appropriate experts to investigate the study drug.

Recruitment

Recruitment details:

Patients enrolled with one of the diagnoses: acutely decompensated heart failure, acute respiratory failure, acute infection, rheumatic disease, and ischemic stroke. They also were required to meet additional criteria that placed them at high prolonged risk of VTE. Patients were randomized 1:1 to either betrixaban or enoxaparin treatment group.

Pre-assignment

Screening details:

To maintain the blind, patients assigned to the betrixaban group received betrixaban capsules for 35 to 42 days and daily subcutaneous (SQ) injections of enoxaparin placebo for 10 ± 4 days, and patients assigned to the enoxaparin group received daily SQ injections of enoxaparin for 10 ± 4 days and betrixaban placebo capsules for 35 to 42 days.
