Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	24 June 2015
Is this the analysis of the primary completion data?	Yes
Primary completion date	24 June 2015
Global end of trial reached?	Yes
Global end of trial date	24 June 2015
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The objective of this study is to assess the safety and efficacy of using bivalirudin instead of unfractionated heparin (UFH) in transcatheter aortic valve replacements (TAVR). The primary hypothesis of BRAVO 3 was that bivalirudin would reduce major bleeding compared with heparin in TAVR procedures. Results for all participants enrolled into the randomized trial (BRAVO 3) are presented.

Protection of trial subjects:

This study was conducted in accordance with International Conference on Harmonisation (ICH) Good Clinical Practice, and the principles of the Declaration of Helsinki, in addition to following the laws and regulations of the country or countries in which a study is conducted.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	18 October 2012
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Canada: 75
Country: Number of subjects enrolled	Switzerland: 47
Country: Number of subjects enrolled	Netherlands: 20
Country: Number of subjects enrolled	United Kingdom: 18
Country: Number of subjects enrolled	France: 214
Country: Number of subjects enrolled	Germany: 353
Country: Number of subjects enrolled	Italy: 76
Worldwide total number of subjects	803
EEA total number of subjects	681

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0

Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	21
From 65 to 84 years	454
85 years and over	328

Subject disposition

Recruitment

Recruitment details: -

Pre-assignment

Screening details:

Screening was to take place within 30 days of the start of the study. Screening assessments included review of inclusion/exclusion criteria, signature of informed consent, 12-lead electrocardiogram (ECG), clinical laboratory assessments, measurement of left ventricular ejection fraction (LVEF), and the start of AE or serious AE (SAE) report.

Period 1

Period 1 title	BRAVO 3 (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	Bivalirudin

Arm description:

Bivalirudin administered as a bolus and intravenous (IV) infusion. It was recommended that the bolus (0.75 milligrams per kilogram [mg/kg]) be directly administered through the valve delivery sheath immediately following its successful delivery via percutaneous femoral access. Systemic IV administration of the bolus dose was also acceptable. The bivalirudin IV infusion was initiated immediately after the bolus administration. All wires, catheters, and sheaths were to be flushed with heparinized saline.

Arm type	Experimental
Investigational medicinal product name	Bivalirudin
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Anticoagulant and preservative solution for blood
Routes of administration	Intravenous bolus use

Dosage and administration details:

The bivalirudin IV infusion was initiated immediately after the bolus administration at the following doses:

Subjects with normal renal function (glomerular filtration rate [GFR] ≥ 60 mL/min): 1.75 milligram per kilogram per hour (mg/kg/hr) continuous IV infusion until successful valve treatment was achieved

Subjects with moderate renal impairment (GFR of 30-59 mL/min): 1.4 mg/kg/hr continuous IV infusion until successful valve treatment was achieved

Subjects with severe renal impairment (GFR < 30 mL/min): 1.0 mg/kg/hr continuous IV infusion until successful valve treatment was achieved

The GFR was calculated centrally and provided to the investigators during randomization. The IV infusion was to continue until successful valve treatment was achieved. Routine assessment of the activated clotting time (ACT) was not required.

Arm title	Unfractionated heparin (UFH)
------------------	------------------------------

Arm description:

The dose of UFH adhered to the standard institutional practice. An ACT target ≥ 250 seconds was recommended. All wires, catheters, and sheaths were to be flushed with heparinized saline.

Arm type	Active comparator
----------	-------------------

Investigational medicinal product name	Unfractionated Heparin
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Anticoagulant and preservative solution for blood
Routes of administration	Intravenous use

Dosage and administration details:

The dose of UFH should adhere to the standard institutional practice. An ACT target ≥ 250 seconds was recommended.

Number of subjects in period 1	Bivalirudin	Unfractionated heparin (UFH)
Started	405	398
Signed consent form (Intent to treat)	404	398
Received at least 1 dose of study drug	393 ^[1]	394
BRAVO 2 feasibility cohort	65 ^[2]	0 ^[3]
Completed	394	388
Not completed	11	10
Consent withdrawn by subject	1	-
Inclusion/Exclusion criteria not met	3	-
Physician decision: Day 30 visit < 23 days	1	5
Did not sign consent form	1	-
Reason not specified: No 30 day visit	2	2
Lost to follow-up	1	2
Physician decision: No 30 day visit	2	1

Notes:

[1] - The number of subjects at this milestone seems inconsistent with the number of subjects in the arm. It is expected that the number of subjects will be greater than, or equal to the number that completed, minus those who left.

Justification: All but one patient in the bivalirudin group (did not sign consent form) comprised the intent-to-treat (ITT) population. In the ITT population, 11 patients in the bivalirudin and four patients in the UFH group did not receive randomized study drug.

[2] - The number of subjects at this milestone seems inconsistent with the number of subjects in the arm. It is expected that the number of subjects will be greater than, or equal to the number that completed, minus those who left.

Justification: The first two participants at each site who met inclusion criteria were treated with bivalirudin and comprised the feasibility cohort (BRAVO 2). This cohort was analyzed separately from the randomized trial cohort.

[3] - The number of subjects at this milestone seems inconsistent with the number of subjects in the arm. It is expected that the number of subjects will be greater than, or equal to the number that completed, minus those who left.

Justification: The first two participants at each site who met inclusion criteria were treated with bivalirudin and comprised the feasibility cohort (BRAVO 2). This cohort was analyzed separately from the randomized trial cohort and did not include participants treated with UFH.

Baseline characteristics

End point title	Net adverse clinical events (NACE) at up to 30 days
End point description:	
<p>The net adverse cardiac events (NACE) at 30 days is the composite of major adverse cardiovascular events (MACE) + major bleeding (BARC type $\geq 3b$). The composite of MACE is defined as all-cause mortality, myocardial infarction (MI), and stroke. A participant was defined to have a composite event if the participant experienced at least 1 of the components. If the participant did not have any of the components, then he or she did not have the composite endpoint. If a participant had more than 1 of the components, he or she was only counted once in the determination of the total number of participants experiencing the composite endpoint.</p>

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
29 August 2012	<p>Amendment number 1 on 29 August 2012 included the following clinical changes to the protocol:</p> <ul style="list-style-type: none">• Clarification of secondary endpoints. Valve performance indicators and TAVR-specific complications and rate of persistent, profound hypotension were deleted.• Correction on listed document for information on potential risks of bivalirudin.• Inclusion of patients with severe renal impairment was specified on request of regulatory authorities; only dialysis-dependent patients were excluded.• Clarification of 30 days patient management following PCI irrespective of drug-eluting stents (DES) or bare-metal stents (BMS).• The following examinations had only to be done once if screening and randomisation were close together (≤ 48 hrs): medical history, medical examination, neurological assessment (Rankin score), blood hematology, blood chemistry.• Dose justification for bivalirudin was added at the request of regulatory authorities• Neurological examination for the study population was specified. Detailed neurological assessment (only for the magnetic resonance imaging [MRI]-substudy) has been clarified.• LVEF to be done only at screening.• International normalized ratio (INR) to be done only at randomization.• Pregnancy test added at the request of regulatory authorities.• Any ECG source can be used for the ECG examination: 12-lead ECG examination changed to ECG.• Changes to enrollment and pre-procedure management• Arterial site and sheath size were deleted.• Management of bleeding while on treatment with bivalirudin added on request of regulatory authority.• Examinations for follow-up visit were updated.• Scheduled corrected to include AE-recording up to hospital discharge.• Observational period up to day 30 specified.• Pre-TAVR-MRI not needed for MRI-substudy.• In addition, several administrative changes were made and typos were fixed.

12 February 2014	<p>Amendment number 2 on 12 February 2014 included the following clinical changes to the protocol:</p> <ul style="list-style-type: none"> • Change to the primary endpoint. The definition of the primary study endpoint of major bleeding changed to BARC type $\geq 3b$ (from BARC type ≥ 3). • Change to the secondary endpoints related to and consistent with the change to the primary endpoint. • Text describing BARC bleeding by type revised for consistency with the current primary and secondary endpoint designations and for completeness. • Clarification to procedures for 30-day follow-up to specify that in the event of phone follow-up for study patients, data collection was with the health care professional. • Clarification to procedures for study drug administration to specify flushing with heparinized saline, in line with best practices and supportive documentation. • Clarification to procedure for bivalirudin vial reconstitution to most accurately convey time that may be needed for dissolution. • Change to BRAVO MRI Substudy neurological assessments to designate National Institutes of Health Stroke Scale (NIHSS) and Mini-Mental State Examination (MMSE) as optional. • Clarification to BRAVO Economic Substudy text with more precise wording and additional description. • In addition, several administrative changes were made and typos were fixed.
30 August 2014	<p>Amendment number 3 on 30 August 2014 complied with a recommendation from the Data and Safety Monitoring Board (DSMB) to increase the sample size of the trial based on DSMB review of the second interim analysis of the trial according to prespecified statistical methods.</p> <p>The BRAVO 2/3 study sample size was designed to achieve 80% power and was based on estimated bleeding rate. The trial was also designed to include a second interim analysis after the enrolment of 340 randomised patients (approximately 2/3 of the projected study enrolment). The second interim analysis was an unblinded determination of major bleeding rates in each BRAVO 2/3 treatment group, observed relative risk reduction, and conditional power based on assumed sample sizes.</p> <p>The DSMB reviewed summary reports of the second interim analysis and the adaptive sample size calculations prepared by independent statisticians and convened on 22 May 2014 to determine their recommendation. On 23 May 2014, the DSMB issued a recommendation to continue the trial unmodified until the final number of randomized patients reached the upper limit of 800 patients defined in the interim statistical analysis plan.</p> <p>Accordingly, the following changes were made to the protocol:</p> <ul style="list-style-type: none"> • Change to the total number of patients to be included in the trial, from 620 to 870. • Change to the number of randomized patients to be included in the trial, from 550 to 800. • A description of DSMB review of the second interim analysis results and addition of the consequent DSMB recommendation.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
