

Clinical trial results:

Efficacy, safety, and tolerability of oral Cebranopadol versus morphine sulphate PR in subjects with chronic moderate to severe pain related to cancer.

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	29 January 2016
Is this the analysis of the primary completion data?	Yes
Primary completion date	16 October 2015
Global end of trial reached?	Yes
Global end of trial date	16 October 2015
Was the trial ended prematurely?	Yes

Notes:

General information about the trial

Main objective of the trial:

The primary objective is to evaluate the efficacy of orally administered Cebranopadol in comparison with morphine sulfate PR in subjects suffering from chronic moderate to severe pain related to cancer.

Protection of trial subjects:

The trial was conducted according to ICH-GCP guidelines, the applicable local laws, and in accordance with the ethical principles that have their origins in the Declaration of Helsinki. Regulatory and competent authorities were notified of the trial as required by national regulations, and, where necessary, relevant authorization was obtained.

Subjects were informed and monitored by the investigator not to take prohibited medications.

The last intake of Investigational Medicinal Product (IMP) took place in the evening of the day of the End of Treatment Visit. The use of rescue medication was allowed until the next day. From that day onwards (Follow-up Period), subjects were allowed to use any analgesic concomitant medication (unless specified otherwise under concomitant medications/therapies) or could start their participation in the extension trial (KF6005/09). For subjects not participating in the extension trial, a Follow-up Visit was planned 4 – 7 days after last IMP intake. At least 14 days (up to 18 days) after the End of Treatment Visit, investigators were to call the subjects for a final update on adverse events.

Background therapy:

Allowed concomitant treatments with certain limitations were:

- Hypnotics.
- Anti-emetics for treatment of adverse events or as part of a chemotherapy and/or radiotherapy regimen.
- Non-steroidal anti-inflammatory & antirheumatic drugs & non-opioid analgesics.
- Chemotherapy & hormonal anti-cancer therapy.
- Radiotherapy (pain-relieving radiotherapy was not allowed).
- Laxatives.
- Serotonin & noradrenaline reuptake inhibitors, anticonvulsants, neuroleptics and antiparkinsonian drugs
- Physiotherapy and other non-pharmacological pain therapy.
- Corticosteroids and bisphosphonates.
- Strong inducers or inhibitors of cytochrome P450 3A4, if stable for at least 2 weeks before enrollment.

Evidence for comparator:

Morphine sulfate PR was selected as comparator because its mechanism of action is primarily based on MOP agonism, whereas cebranopadol combines MOP agonism with NOP agonism, and represents the most commonly used gold standard opioid with the longest history of use in patients suffering from cancer-related pain. It is broadly acknowledged that morphine is highly effective in the treatment of cancer-related pain.

Actual start date of recruitment	29 October 2013
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Poland: 58
Country: Number of subjects enrolled	Slovakia: 40
Country: Number of subjects enrolled	Spain: 2
Country: Number of subjects enrolled	Croatia: 3
Country: Number of subjects enrolled	Austria: 5
Country: Number of subjects enrolled	Belgium: 5
Country: Number of subjects enrolled	Bulgaria: 18
Country: Number of subjects enrolled	Denmark: 3
Country: Number of subjects enrolled	Germany: 35
Country: Number of subjects enrolled	Hungary: 12
Country: Number of subjects enrolled	Chile: 2
Country: Number of subjects enrolled	Romania: 8
Country: Number of subjects enrolled	Serbia: 8
Country: Number of subjects enrolled	United Kingdom: 1
Worldwide total number of subjects	200
EEA total number of subjects	190

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	103
From 65 to 84 years	94
85 years and over	3

Subject disposition

Recruitment

Recruitment details:

The trial started on 29 Oct 2013 with the enrollment of the first subject and was completed on 16 Oct 2015 when the last subject completed the last follow-up examination.

Pre-assignment

Screening details:

A total of 200 subjects were enrolled.

Pre-assignment period milestones

Number of subjects started	200
Intermediate milestone: Number of subjects	Allocated to treatment: 132
Intermediate milestone: Number of subjects	Treated with IMP: 126
Number of subjects completed	126

Pre-assignment subject non-completion reasons

Reason: Number of subjects	Consent withdrawn by subject: 4
Reason: Number of subjects	inclusion/exclusion criteria not met: 65
Reason: Number of subjects	Adverse event, non-fatal: 1
Reason: Number of subjects	Adverse event, serious fatal: 2
Reason: Number of subjects	not specified: 2

Period 1

Period 1 title	Overall trial (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Investigator, Monitor, Subject, Data analyst, Carer, Assessor

Blinding implementation details:

A double-dummy technique was used to ensure blinding of the IMP.

Arms

Are arms mutually exclusive?	Yes
Arm title	Cebranopadol

Arm description:

Subjects took one or two tablet(s) of cebranopadol in the morning and one or two placebo double-dummy morphine-like capsule(s) in the morning and the evening.

Arm type	Experimental
Investigational medicinal product name	Cebranopadol
Investigational medicinal product code	GRT6005
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

The minimum daily dose of cebranopadol was 200 µg. The incremental/decremental dose of cebranopadol was 200 µg per day. The maximum daily dose was 1000 µg/day. The aim of the titration was to reach the subject's individual optimal dose defined as a balance between self-reported analgesia

and side effects. The first decision on uptitration was taken on Day 3 (after 1 day of IMP intake). From Day 4 on, decisions for uptitration to the next higher dose step were taken after at least 4 days on a dose level. During the Titration Phase, downward titration by 1 step was allowed. In the Maintenance Phase, subjects continued at the same dose that provided optimal therapeutic benefit during the Titration Phase. No dose adjustments were allowed during the Maintenance Phase.

Arm title	Morphine Prolonged Release
Arm description: Subjects took morphine capsule(s) in the morning and in the evening and placebo double-dummy cebranopadol-like tablet(s) in the morning.	
Arm type	Active comparator
Investigational medicinal product name	Morphine Prolonged Release
Investigational medicinal product code	
Other name	Morphine sulfate pentahydrate
Pharmaceutical forms	Capsule, hard
Routes of administration	Oral use

Dosage and administration details:

The minimum daily dose of morphine prolonged release was 30 mg. The incremental/decremental dose of morphine was 30 mg per day. The maximum daily dose was 150 mg. The aim of the titration was to reach the subject's individual optimal dose defined as a balance between self-reported analgesia and side effects. The first decision on uptitration was taken on Day 3 (after 1 day of IMP intake). From Day 4 on, decisions for uptitration to the next higher dose step were taken after at least 4 days on a dose level. During the Titration Phase, downward titration by 1 step was allowed. In the Maintenance Phase, subjects continued at the same dose that provided optimal therapeutic benefit during the Titration Phase. No dose adjustments were allowed during the Maintenance Phase.

Number of subjects in period 1^[1]	Cebranopadol	Morphine Prolonged Release
Started	65	61
Completed	41	45
Not completed	24	16
Adverse event, serious fatal	3	2
Consent withdrawn by subject	7	5
Adverse event, non-fatal	12	5
inclusion/exclusion criteria not met	1	-
Lost to follow-up	-	1
not specified	1	1
Lack of efficacy	-	1
Protocol deviation	-	1

Notes:

[1] - The number of subjects reported to be in the baseline period are not the same as the worldwide number enrolled in the trial. It is expected that these numbers will be the same.

Justification: 200 subjects were enrolled. The baseline period reports the number of subjects that were exposed to at least one dose of Investigational Medicinal Product (IMP), i.e. Safety Analysis Set.

Baseline pain intensity			
For this assessment, each subject was asked "Please rate your pain by selecting the one number that best describes your pain on average during the last 24 hours" on an 11-point Numerical Rating Scale, where a score of 0 indicated "no pain" and a score of 10 indicated "pain as bad as you can imagine". The value was calculated from the mean of the 3 assessments of average pain intensity in the last 24 hours recorded during the last 3 days prior to the dosing visit, calculated when at least one assessment in this three-day window was available.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
01 March 2013	<p>This amendment was in place before First Subject Enrolled.</p> <p>The selection criteria were adapted to exclude opioid-naive subjects. The primary endpoint was changed to assess the amount of rescue medication taken. The primary endpoint was analyzed on the Full Analysis Set and on the Per Protocol Set. The number of planned interim analyses was reduced to 1. The sample size was adapted to include 524 allocated subjects due to the change of the primary endpoint.</p> <p>Morphine sulfate PR as a once daily formulation was replaced by a twice daily formulation. Administration strategy (double-dummy), selection criteria, rules for concomitant medication and times for pain assessments were adapted accordingly to cover the change of comparator formulation and improved scientific knowledge on cebranopadol.</p> <p>It was planned to offer an extension trial to subjects who completed the treatment of this trial (separate trial protocol).</p>
16 December 2014	<p>Protocol exclusion and discontinuation criteria on creatinine clearance were adapted based on new scientific data. Exclusion criteria were adapted to allow re-enrollment of subjects who would be eligible for the trial due to the changes made as part of this amendment or if a subject was an enrollment failure due to technical failure of equipment. The enrollment period was extended. For allowed concomitant medication and therapies, clarifications were made for chemotherapy, medications affecting the QT interval, corticosteroids and anti-emetic treatment. Further clarifications concerned history/presence of cerebral tumor, check of previous opioid medication and assessment of Child-Pugh score and DN4 questionnaire. The tests to be performed when a subject prematurely discontinues the trial were extended. The statistical sections of the protocol were aligned with the descriptions given in the statistical analysis plan. Sensitivity analyses were changed to allow for a direct comparison of the primary and sensitivity results of the primary endpoint assuming missing mechanisms. Reference to Forest Research Institute was removed as they were no longer involved in the development of cebranopadol.</p>

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
