

## Clinical trial results:

### An Open-label, Multicenter Extension Study to Evaluate the Long-term Safety and Efficacy of Lacosamide as Adjunctive Therapy for Uncontrolled Primary Generalized Tonic-Clonic Seizures in Subjects With Idiopathic Generalized Epilepsy

#### Summary

EudraCT number	2012-001770-29
Trial protocol	SK HU DE ES CZ PT BE PL BG FR RO Outside EU/EEA
Global end of trial date	30 March 2023

#### Results information

Result version number	v2 (current)
This version publication date	06 March 2024
First version publication date	14 October 2023
Version creation reason	<ul style="list-style-type: none"><li>• Correction of full data set Alignment with final posting on ClinicalTrials.gov after NIH review.</li></ul>

#### Trial information

##### Trial identification

Sponsor protocol code	EP0012
-----------------------	--------

##### Additional study identifiers

ISRCTN number	-
ClinicalTrials.gov id (NCT number)	NCT02408549
WHO universal trial number (UTN)	-

Notes:

Notes:

#### Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	Yes
EMA paediatric investigation plan number(s)	EMA-000402-PIP03-17
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	Yes

Notes:

## Results analysis stage

Analysis stage	Final
Date of interim/final analysis	03 May 2023
Is this the analysis of the primary completion data?	Yes
Primary completion date	30 March 2023
Global end of trial reached?	Yes
Global end of trial date	30 March 2023
Was the trial ended prematurely?	No

Notes:

## General information about the trial

Main objective of the trial:

Assess the safety and tolerability of lacosamide (LCM) as an adjunctive therapy for uncontrolled primary generalized tonic-clonic seizures (PGTCS) in subjects with idiopathic generalized epilepsy (IGE) during long-term exposure.

Protection of trial subjects:

During the conduct of the study all participants were closely monitored.

Background therapy:

Concomitant therapy as permitted in the protocol.

Evidence for comparator:

Not applicable

Actual start date of recruitment	03 August 2015
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

## Population of trial subjects

### Subjects enrolled per country

Country: Number of subjects enrolled	Australia: 15
Country: Number of subjects enrolled	Brazil: 16
Country: Number of subjects enrolled	Bulgaria: 11
Country: Number of subjects enrolled	China: 3
Country: Number of subjects enrolled	Czechia: 16
Country: Number of subjects enrolled	France: 5
Country: Number of subjects enrolled	Germany: 3
Country: Number of subjects enrolled	Hungary: 12
Country: Number of subjects enrolled	Israel: 7
Country: Number of subjects enrolled	Italy: 1
Country: Number of subjects enrolled	Japan: 37
Country: Number of subjects enrolled	Mexico: 1
Country: Number of subjects enrolled	Poland: 16
Country: Number of subjects enrolled	Portugal: 1
Country: Number of subjects enrolled	Romania: 8
Country: Number of subjects enrolled	Russian Federation: 31

Country: Number of subjects enrolled	Slovakia: 11
Country: Number of subjects enrolled	Korea, Republic of: 6
Country: Number of subjects enrolled	Spain: 13
Country: Number of subjects enrolled	Taiwan: 2
Country: Number of subjects enrolled	United States: 24
Worldwide total number of subjects	239
EEA total number of subjects	97

Notes:

<b>Subjects enrolled per age group</b>	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	16
Adolescents (12-17 years)	28
Adults (18-64 years)	194
From 65 to 84 years	1
85 years and over	0

## Subject disposition

### Recruitment

Recruitment details:

The study started to enroll participants in August 2015 and concluded in March 2023. Study participants from SP0982 [NCT02408523], who met EP0012 eligibility criteria were enrolled.

### Pre-assignment

Screening details:

The Participant Flow refers to the Safety Set. The Safety Set included all study participants who received at least 1 dose of Investigational medicinal product (IMP) during this study.

### Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Not applicable
Blinding used	Not blinded

### Arms

Arm title	All participants (lacosamide)
-----------	-------------------------------

Arm description:

Participants included in this treatment group received at least one dose of LCM as EP0012 protocol entry criteria. The dose range for pediatric participants weighing <50 kg is from 4 mg/kg/day (oral solution) to 12 mg/kg/day (oral solution), for pediatric participants weighing ≥50 kg, the dose range is from 200 mg/day (tablets) to 600 mg/day (tablets) and for adult participants, the dose range is from 200 mg/day to 800mg/day (tablets) during the Treatment Period. The LCM dose may be increased or decreased at the investigator's discretion after the study participant received the first dose of LCM in the study. Pediatric participants who initially started on oral solution might have transferred to tablets at Investigator's discretion after achieving ≥50 kgs. LCM was administered orally, twice daily (bid), up to approximately 5 years. Treatment was continued for at least 2 years for adult participants and up to approximately 5 years for pediatric participants.

Arm type	Experimental
Investigational medicinal product name	Lacosamide
Investigational medicinal product code	LCM
Other name	VIMPAT
Pharmaceutical forms	Film-coated tablet
Routes of administration	Oral use

Dosage and administration details:

Participants received LCM orally, bid, at pre-defined timepoints during the Treatment Period.

Investigational medicinal product name	Lacosamide
Investigational medicinal product code	LCM
Other name	VIMPAT
Pharmaceutical forms	Oral solution
Routes of administration	Oral use

Dosage and administration details:

Participants received LCM orally, bid, at pre-defined timepoints during the Treatment Period.

<b>Number of subjects in period 1</b>	<b>All participants (lacosamide)</b>
Started	239
Completed	157
Not completed	82
Adverse event, serious fatal	4
Adverse event, non-fatal	15
Study terminated at site	1
Withdrawal of consent due to business trip	1
Pregnancy	1
Subject moved to another place, far from site	1
Neurology research program closing at site	1
Lost to follow-up	6
Consent withdrawn	30
Site closure	1
Lack of efficacy	17
Protocol deviation	4

## Baseline characteristics

### Reporting groups

Reporting group title	All participants (lacosamide)
-----------------------	-------------------------------

#### Reporting group description:

Participants included in this treatment group received at least one dose of LCM as EP0012 protocol entry criteria. The dose range for pediatric participants weighing <50 kg is from 4 mg/kg/day (oral solution) to 12 mg/kg/day (oral solution), for pediatric participants weighing ≥50 kg, the dose range is from 200 mg/day (tablets) to 600 mg/day (tablets) and for adult participants, the dose range is from 200 mg/day to 800mg/day (tablets) during the Treatment Period. The LCM dose may be increased or decreased at the investigator's discretion after the study participant received the first dose of LCM in the study. Pediatric participants who initially started on oral solution might have transferred to tablets at Investigator's discretion after achieving ≥50 kgs. LCM was administered orally, twice daily (bid), up to approximately 5 years. Treatment was continued for at least 2 years for adult participants and up to approximately 5 years for pediatric participants.

Reporting group values	All participants (lacosamide)	Total

## End points

### End points reporting groups

Reporting group title	All participants (lacosamide)
Reporting group description:	
Participants included in this treatment group received at least one dose of LCM as EP0012 protocol entry criteria. The dose range for pediatric participants weighing <50 kg is from 4 mg/kg/day (oral solution) to 12 mg/kg/day (oral solution), for pediatric participants weighing ≥50 kg, the dose range is from 200 mg/day (tablets) to 600 mg/day (tablets) and for adult participants, the dose range is from 200 mg/day to 800mg/day (tablets) during the Treatment Period. The LCM dose may be increased or decreased at the investigator's discretion after the study participant received the first dose of LCM in the study. Pediatric participants who initially started on oral solution might have transferred to tablets at Investigator's discretion after achieving ≥50 kgs. LCM was administered orally, twice daily (bid), up to approximately 5 years. Treatment was continued for at least 2 years for adult participants and up to approximately 5 years for pediatric participants.	

### Primary: Number of study participants with treatment-emergent adverse events (TEAEs) over the duration of the Treatment Period

End point title	Number of study participants with treatment-emergent adverse events (TEAEs) over the duration of the Treatment Period <sup>[1]</sup>
-----------------	--

#### End point description:

AEs were considered treatment-emergent if event had onset on or after date of first study medication dose in EP0012 and within 30 days following last study medication dose or events whose intensity worsened on or after date of first study medication dose and within 30 days following date of last study medication administration. Adverse Events were reported spontaneously by the participant and/or caregiver or observed by the investigator. The Safety Set included all study participants who received at least 1 dose of IMP during this study.

End point type	Primary
----------------	---------

#### End point timeframe:

From Visit 1 (Week 0) to End of Treatment Period (up to approximately 5 years)

#### Notes:

[1] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: No formal statistical hypothesis testing was planned for this study. Results were summarized as descriptive statistics only.

<b>End point values</b>	All participants (lacosamide)			
Subject group type	Reporting group			
Number of subjects analysed	239			
Units: participants	222			

### Statistical analyses

No statistical analyses for this end point

### Primary: Number of study participants with an increase of up to 25% in days with absence seizures per 28 days during the Treatment Period as compared to the Prospective Baseline (of study SP0982)

End point title	Number of study participants with an increase of up to 25% in days with absence seizures per 28 days during the Treatment Period as compared to the Prospective Baseline (of study
-----------------	--

## End point description:

The number of participants experiencing an increase of up to 25% in the number of days with absence seizures per 28 days during the Treatment Period compared to the Prospective Baseline Period (for those participants with absence seizure data reported in the 4-week Prospective Baseline Period in SP0982) were reported. This period started on the day of Visit 1 of SP0982 and ended the day before Visit 2 of SP0982. For the direct enrollers into EP0012, Prospective Baseline ended the day before Visit 1 (or prior to first dose) of EP0012. The Safety Set included all study participants who received at least 1 dose of IMP during this study. Here, Number of participants analyzed (N) included those participants who were evaluable for the assessment (absence seizures).

End point type	Primary
----------------	---------

## End point timeframe:

From Visit 1 (Week 0) to End of Treatment Period (up to approximately 5 years), compared to the Prospective SP0982 Baseline Period

## Notes:

[2] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: No formal statistical hypothesis testing was planned for this study. Results were summarized as descriptive statistics only.

End point values	All participants (Iacosamide)			
Subject group type	Reporting group			
Number of subjects analysed	93			
Units: participants	5			

## Statistical analyses

No statistical analyses for this end point

## Primary: Number of study participants with new appearance of absence and/or myoclonic seizures during the Treatment Period

End point title	Number of study participants with new appearance of absence and/or myoclonic seizures during the Treatment Period <sup>[3]</sup>
-----------------	--

## End point description:

The number of study participants with appearance of new absence and/or myoclonic seizure types experienced during the Treatment Period but who did not experience in Combined Baseline Period or in seizure classification history, before taking LCM were reported. To determine appearance of new seizure type, the Combined Baseline Period was used. Thus, the participants who directly enrolled into EP0012, the Baseline absence, and/or myoclonic seizure data from SP0982's 4-week Prospective Baseline Period were combined with any reported Baseline absence, and myoclonic seizure information in the daily seizure diary from EP0012 (reported before first dose in EP0012) to recalculate the study participant's Baseline variables such as days with absence, and/or myoclonic seizures per 28 days. The Safety Set included all study participants who received at least 1 dose of IMP during this study.

End point type	Primary
----------------	---------

## End point timeframe:

From Visit 1 (Week 0) to End of Treatment Period (up to approximately 5 years)

## Notes:

[3] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: No formal statistical hypothesis testing was planned for this study. Results were summarized as descriptive statistics only.

<b>End point values</b>	All participants (lacosamide)			
Subject group type	Reporting group			
Number of subjects analysed	239			
Units: participants				
Absence seizures	3			
Myoclonic seizures	5			

## Statistical analyses

No statistical analyses for this end point

### Primary: Number of study participants withdrawn due to TEAEs

End point title	Number of study participants withdrawn due to TEAEs <sup>[4]</sup>
-----------------	--

End point description:

AEs were considered treatment-emergent if event had onset on or after date of first study medication dose in EP0012 and within 30 days following last study medication dose or events whose intensity worsened on or after date of first study medication dose and within 30 days following date of last study medication administration. Adverse Events were reported spontaneously by the participant and/or caregiver or observed by the investigator. The Safety Set included all study participants who received at least 1 dose of IMP during this study.

End point type	Primary

#### End point timeframe:

From Visit 1 (Week 0) to End of Treatment Period (up to approximately 5 years), compared to the Prospective SP0982 Baseline Period

#### Notes:

[13] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: No formal statistical hypothesis testing was planned for this study. Results were summarized as descriptive statistics only.

End point values	All participants (lacosamide)			
Subject group type	Reporting group			
Number of subjects analysed	96			
Units: participants	1			

## Statistical analyses

No statistical analyses for this end point

### Secondary: Percentage of study participants with treatment-emergent marked abnormalities (TEMAs) in hematology parameters (Hemoglobin)

End point title	Percentage of study participants with treatment-emergent marked abnormalities (TEMAs) in hematology parameters (Hemoglobin)
-----------------	---

#### End point description:

TEMA values are defined in the Statistical Analysis Plan (SAP) as significant deviations from the expected range of ageappropriate values. TEMA laboratory results of Hematology parameter, Hemoglobin were those that were observed post-Baseline (BL) during the Treatment Period but not present at BL. For the age range, '2 years (y) to <17 years', the abnormality criteria were '<=95' grams/deciliter (g/dL) (Low) and '>160' g/dL (High). For age range, '>=17 years', the abnormality Criteria were '<=85% of lower limit of normal (LLN)' value (Low) and '>=115% of upper limit of normal (ULN)' value (High) of Hemoglobin in blood. Safety Set was analyzed. Number of participants analyzed included those participants who were evaluable for the assessment. 'n' signifies participants who were evaluable at specified time points. Data for visits wherein at least 1 TEMA value of Hematology parameter (Hemoglobin) observed during the study were reported in this assessment.

## Statistical analyses

No statistical analyses for this end point

### Secondary: Percentage of study participants with treatment-emergent marked abnormalities (TEMAs) in serum chemistry parameters (Glucose)

End point title	Percentage of study participants with treatment-emergent marked abnormalities (TEMAs) in serum chemistry parameters (Glucose)
-----------------	---

End point description:

TEMA values are defined in the SAP as significant deviations from the expected range of ageappropriate values. TEMA laboratory results of Glucose were those that were observed post- BL during the Treatment Period but not present at BL. For the age range, '>1 month-<17 years', the abnormality criteria were from '<2.775' mmol/L (Low) and '>=9.99' mmol/L (High). For age range, '>=17 years', the abnormality criteria were '<2.775' mmol/L (Low) and '>=11.1' mmol/L (High) of serum Glucose. The Safety Set included all study participants who received at least 1 dose of IMP during this study. Number of participants analyzed included those participants who were evaluable for the assessment. 'n' signifies participants who were evaluable at specified time points. Data for visits wherein at least 1 TEMA value of serum chemistry parameter (Glucose) observed during the study were reported in this assessment.

## Statistical analyses

No statistical analyses for this end point

## Secondary: Percentage of study participants with treatment-emergent marked abnormalities (TEMAs) in 12-lead ECG parameter (QRS interval)

End point title	Percentage of study participants with treatment-emergent marked abnormalities (TEMAs) in 12-lead ECG parameter (QRS interval)
-----------------	---

**End point description:**

TEMA values are defined in the SAP as significant deviations from the expected range of ageappropriate values. TEMA ECG results of QRS interval were those that were observed post- BL during the Treatment Period but not present at BL. For the age range, '3 years -<12 years', the abnormality criteria were '>100 ms' (Abn A) and '>25% increase from BL' value (Abn B). For the age range, '>=12 years - <17 years', the abnormality criteria were '>110 ms' (Abn C) and '>25% increase from BL' (Abn D). For age range, '>=17 years', the abnormality criteria were treatment-emergent values above '>100 ms' (Abn E), '>120 ms' (Abn F), or '>140 ms' (Abn G). Safety Set was analyzed. Number of participants analyzed included those participants who were evaluable for the assessment. 'n' signifies participants who were evaluable at specified time points. Data for visits wherein at least 1 TEMA value of ECG parameter (QRS interval) observed during the study were reported in this assessment.

## Statistical analyses

No statistical analyses for this end point

## Secondary: Percentage of study participants with treatment-emergent marked abnormalities (TEMAs) in vital sign measurements (Diastolic Blood Pressure)

End point title	Percentage of study participants with treatment-emergent marked abnormalities (TEMAs) in vital sign measurements (Diastolic Blood Pressure)
-----------------	---

End point description:

TEMA values of Diastolic BP results were those that are observed post- BL during the Treatment Period but not present at BL. For the age range, '3 years - <12 years', the abnormality criteria were '<50 mmHg' (Low) and '>80 mmHg' (High), '>=12 years - <17 years', the abnormality criteria were '<=50 mmHg' (Low) and '>=105 mmHg' (High), and '>=17 years', the abnormality criteria were '<=50 mmHg and decrease from BL of  $\geq 15$  mmHg' (Low A), '>=105 mmHg and increase from BL of  $\geq 15$  mmHg' (High A), '<50 mmHg' (Low B), '>90 mmHg' (High B), and '>100 mmHg' (High C). Diastolic BP were reported as per positions such as 'Sup 3 min', 'Std 1 min', and 'Std 3 min'. Safety Set was analyzed. Number of participants analyzed included those participants who were evaluable for the assessment. 'n' signifies participants who were evaluable at specified time points. Data for visits wherein at least 1 TEMA

value of Diastolic BP observed during the study were reported in this assessment.

## Statistical analyses

No statistical analyses for this end point

## Secondary: Percentage of study participants with treatment-emergent marked abnormalities (TEMAs) in vital sign measurements (Body Weight)

End point title	Percentage of study participants with treatment-emergent marked abnormalities (TEMAs) in vital sign measurements (Body Weight)
-----------------	--

End point description:

TEMA values are defined in the SAP as significant deviations from the expected range of ageappropriate values. TEMA vital signs parameter results were those that are observed post- BL during the Treatment Period but not present at Baseline. For the age range, '1 month - <17 years', the abnormality criteria were '<3% of normal body weight' in Kilograms (kg) or '>97% of normal body weight' in kgs. Here, '<3% of normal' is presented as 'Low' and '>97% of normal' is presented as 'High'. For the age range ' $\geq 17$  years', the abnormality criteria were 'Increase/decrease of  $\geq 10\%$ ' body weight in kgs (presented as Inc/Dec A) or 'Increase/decrease of  $\geq 7\%$ ' body weight in kgs (presented as Inc/Dec B). Safety Set was analyzed. N= participants who were evaluable for the assessment. 'n'= participants who were evaluable at specified time points. Data for visits wherein at least 1 TEMA body weight value observed during the study were reported in this assessment.

## Secondary: Percent change in Primary Generalized Tonic-clonic seizure (PGTCS) frequency per 28 days from Combined Baseline

End point title	Percent change in Primary Generalized Tonic-clonic seizure (PGTCS) frequency per 28 days from Combined Baseline
-----------------	---

End point description:

The 28-day PGTCS frequency during the relative period was subtracted from the 28-day Combined Baseline PGTCS frequency and the result was divided by 28-day Combined Baseline PGTCS frequency and the result was then multiplied by 100 to get percent change in PGTCS frequency per 28 days from Combined Baseline Period (CB) to the appropriate analysis Period. The CB was defined as the combined 12-week Historical Baseline and 4-week Prospective Baseline periods immediately prior to randomization in the study SP0982 or prior to Visit 1 (first dose) if direct enrollers in EP0012. Full Analysis Set (FAS) was a subset of the Safety Set and included all study participants with seizure diary data for at least 1 day during this study.

## Adverse events

### Adverse events information

Timeframe for reporting adverse events:

From Visit 1 (Week 0) to End of Treatment Period (up to approximately 5 years)

Adverse event reporting additional description:

AEs were treatment-emergent if event had onset on or after date of first study medication dose in EP0012 and within 30 days following last study medication dose or events whose intensity worsened on or after date of first study medication dose and within 30 days following date of last study medication administration. TEAEs were assessed on SS.

Assessment type	Non-systematic

### Reporting groups

Reporting group title	All participants (lacosamide)
-----------------------	-------------------------------

Reporting group description:

Participants included in this treatment group received at least one dose of LCM as EP0012 protocol entry criteria. The dose range for pediatric participants weighing <50 kg is from 4 mg/kg/day (oral solution) to 12 mg/kg/day (oral solution), for pediatric participants weighing ≥50 kg, the dose range is from 200 mg/day (tablets) to 600 mg/day (tablets) and for adult participants, the dose range is from 200 mg/day to 800mg/day (tablets) during the Treatment Period. The LCM dose may be increased or decreased at the investigator's discretion after the study participant received the first dose of LCM in the study.

Pediatric participants who initially started on oral solution might have transferred to tablets at Investigator's discretion after achieving ≥50 kgs. LCM was administered orally, twice daily (bid), up to approximately 5 years. Treatment was continued for at least 2 years for adult participants and up to approximately 5 years for pediatric participants.

## More information

### Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
27 January 2015	<p>Global Protocol Amendment 1, dated 27 Jan 2015, provided the following primary and key revisions. No study participants entered the study prior to the date of amendment. The primary purpose of this substantial amendment followed the amendment made to the SP0982 protocol, which was to identify significant changes to the study design and the inclusion of pediatric study participants (<math>\geq 4</math> to 12 years of age). The duration of EP0012 was clarified as at least 2 years, and LCM plasma concentration analysis was removed. Clarification on study participants being able to participate in a substudy at some sites, without being withdrawn from EP0012, was added. The use of concomitant medications and treatments was clarified and permitted and prohibited concomitant treatments were clarified to be consistent with SP0982. For pediatric study participants <math>&lt; 50</math> kg, a Dispensation Visit was added 12 weeks after each 24-weekly visit from Year 3 onwards, in order to dispense LCM solution. Behavior Rating Inventory of Executive Function® - Preschool Version (BRIEF®-P) was added and socio-professional data assessment was removed in this study.</p>
09 June 2016	<p>Global Protocol Amendment 2, dated 09 Jun 2016, provided the following primary and key revisions. Thirty study participants entered the study prior to the date of amendment.</p> <p>The protocol was amended following a request from the Taiwanese Ministry of Health and Welfare: for dose escalation, study participants who were eligible Baseline failures from SP0982 had to remain on the dose for <math>\geq 7</math> days before a subsequent dose escalation. Additionally, the purpose of the amendment was to remove superfluous description of a substudy, to clarify the requirement for ECG at subsequent visits, requirement for endocrinology and timing of endocrinology assessments, pregnancy testing, definition of contraceptive methods, and seizure count, and to add a definition of the Enrolled Set (ES). Several assessments were removed from Years 3 to 5, including brief physical examination (complete physical examination instead), complete neurological examination (brief neurological examination instead), and health outcome measures. The protocol was also updated according to the new UCB protocol template, for example, with the addition of text regarding potential drug-induced liver injury (PDILI).</p>

29 November 2017	<p>Global Protocol Amendment 3, dated 29 Nov 2017, provided the following primary and key revisions. One hundred forty-four study participants entered the study prior to the date of amendment.</p> <p>The primary purpose of this amendment was to simplify the assessments and procedures for all study participants during the first 94 weeks of study and to simplify the assessments and procedures for adults after Week 94. Pediatric assessments were kept as they were after Week 94 for regulatory purposes. In addition, the following changes were made:</p> <ul style="list-style-type: none"> <li>• To allow the Safety Follow-up for study participants tapered in SP0982 after the 125th event occurred in SP0982; the 4-week Safety Follow-up was to be started at Visit 1 of EP0012.</li> <li>• In the schedule of study assessments for treatment Years 1 to 2, a footnote was added to explain that Visit 6, Visit 7, and Visit 10 were not performed according to Protocol Amendment 3. Footnote 'b' had 'vital signs' removed and for footnote 'd,' Week 30, Week 38, and Week 78 were added to the footnote for consistency.</li> <li>• A schedule of study assessments for Years 3 through 5 for EP0012 (Treatment Period, Early Termination (ET) Visit, Termination Visit, and Unscheduled Visit for study participants <math>\geq 18</math> years) was added.</li> <li>• In the schedule of study assessments for Years 3 through 5, footnotes were amended to specify that the Taper Period and Safety Follow-up Visit included some of the study participants who tapered into SP0982 after the 125th event and who consented to enter EP0012 for the Safety Follow-up Visit only.</li> <li>• To restructure the safety variables.</li> <li>• To align the planned number of study participants with the pivotal study SP0982.</li> <li>• To update the introduction section with regulatory information on the marketing authorization of Vimpat and to provide an update on the LCM clinical program.</li> <li>• To clarify the PDILI criteria requiring immediate and permanent discontinuation of the study medication.</li> </ul>
13 December 2019	<p>Global Protocol Amendment 4, dated 13 Dec 2019, provided the following primary and key revisions. All study participants entered the study prior to the date of amendment.</p> <p>The primary purpose of this substantial amendment was to extend the treatment of the study participants and have LCM available for the study participants till the main approvals for an extended PGTCs indication was obtained. UCB sought to obtain the approvals in first instance in US, EU, and Japan.</p> <p>In addition, primary generalized tonic-clonic seizures was globally changed to PGTCs.</p>

Notes:

## Interruptions (globally)

Were there any global interruptions to the trial? No

## Limitations and caveats

None reported
