General information about the trial

Main objective of the trial:

To evaluate the reduction of low-density lipoprotein cholesterol (LDL-C) by alirocumab as add-on therapy to atorvastatin in comparison with ezetimibe as add-on therapy to atorvastatin, in comparison with doubling the atorvastatin dose, or in comparison with a therapy switch from atorvastatin to rosuvastatin, after 24 weeks of treatment in subjects with hypercholesterolemia at high cardiovascular (CV) risk.

Protection of trial subjects:

This study was conducted in accordance with the ethical principles that have their origin in the Declaration of Helsinki and that are consistent with the International Conference on Harmonisation (ICH) guidelines for Good Clinical Practice (GCP) and applicable regulatory requirements.

Background therapy:

Lipid-modifying therapies (LMT) that were allowed as background therapy included fish oils with ≥1000 mg of omega-3 fatty acids, fenofibrate, bile acid-binding sequestrates (eg, cholestyramine), and niacin. Doses of these medications were to remain stable for at least 4 weeks (at least 6 weeks for fenofibrate) before the screening visit, during the screening period, and during the double-blind treatment period.

Subject disposition

Recruitment

Recruitment details:

The study was conducted at 85 sites in 9 countries. Overall, 859 subjects were screened between 24 October 2012 and 26 September 2013, 504 of whom were screen failures. Screen failures were mainly due to exclusion criteria met.

Pre-assignment

Screening details:

Randomization was stratified according to prior history of myocardial infarction or ischemic stroke, and intensity of statin treatment (atorvastatin 20 or 40 mg). Assignment to treatment arms was done centrally using an Interactive Voice/Web Response System in a 1:1:1:1:1:1:1 ratio after confirmation of selection criteria.

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
13 February 2013	The purpose of this amendment was to: - Add an open-label 4-week atorvastatin baseline dose (20 mg or 40 mg) regimen run-in period during the screening period for subjects who, at the discretion of the Investigator, have not been on a stable dose of atorvastatin (20 mg or 40 mg) for 4 weeks, are being switched from another statin to atorvastatin, or are not on a statin but should be according to local guidance. - Redefine the exclusion of subjects with HbA 1c >8.5% to HbA 1c >9%. - Clarify that a repeat lab was allowed for Thyroid-stimulating hormone (TSH) eligibility laboratory results. - Clarify fulfillment of applicable local regulatory requirements through the Informed consent form (ICF) or a local protocol addendum in women of childbearing potential and add a definition for the duration of required contraception use after discontinuation of the study drug. - Clarify LMTs that were allowed as background therapy. - Add contingency language to ensure the continuity of study drug treatment without interruption (in the event the manufacturer faced any performance or supply issues of the auto-injector). - Remove hospitalization for unanticipated coronary revascularization from the list of Clinical Events Committee (CEC) adjudication categories, and add that all coronary revascularizations would be submitted to the CEC. - Clarify that reporting of adverse events (AEs) of interest that required accelerated reporting would be done within 24 hours of learning of the event. - Make miscellaneous administrative clarifications.
08 April 2014	The purpose of this amendment was to: - Modify the primary efficacy analysis population to the ITT population for the primary and secondary efficacy endpoints, which would include assessments both on study treatment and off study treatment through the analysis period. - An Mixed effect model with repeated measures (MMRM) would be used for the primary endpoint and for other continuous secondary endpoints anticipated to have normally distributed data. - For continuous endpoints expected to have non-normally distributed data, the robust regression method would be used to test the treatment group differences and missing data would be handled using multiple imputation approach. - For binary endpoints, logistic regression method would be used to test the treatment group differences and missing data would be handled using multiple imputation approach. - Supportive analyses had been added for the primary and secondary efficacy endpoints, pooling treatment groups across the baseline dose regimens.- Primary and key secondary endpoints would also be analyzed in the mITT population to assess the drug effect during the study treatment period (on treatment approach). - The list of key and other secondary efficacy endpoints and estimands (ITT estimand or on-treatment estimand) were adjusted.- For safety, the initial review of data would be based on the pooled baseline dose regimens, with the individual treatment groups within the atorvastatin baseline dose regimens as supportive.- Update language on CV events to be reported to the CEC for adjudication, and to clarify cerebrovascular events.- Clarify that LDL-C measured and calculated would be performed at weeks 0 and 24. - Update language on collection of partner pregnancy data, per the ODYSSEY program. - Update categorization of AEs (update language on how to record injection site reactions that were not related to study drug). - Make minor corrections/clarifications.
