General information about the trial

Main objective of the trial:

This study is being done to compare survival using pembrolizumab (SCH 900475, MK-3475) or standard chemotherapy for participants with advanced melanoma (MEL) who have progressed after prior therapy. Participants were initially randomized to receive either low-dose pembrolizumab, high-dose pembrolizumab or Investigator-choice chemotherapy (ICC) in an open-label fashion. The four standard ICC choices were: carboplatin + paclitaxel, paclitaxel alone, dacarbazine, or temozolomide. Participants on standard chemotherapy who experienced disease progression may have been eligible to switch to treatment with pembrolizumab provided they met protocol-specified requirements for switching. With Amendment 03, all ongoing pembrolizumab and switched participants will be treated with open-label, fixed dose pembrolizumab 200 mg every 3 weeks (Q3W), instead of weight-based dosing of pembrolizumab.

Protection of trial subjects:

This study was conducted in conformance with Good Clinical Practice standards and applicable country and/or local statutes and regulations regarding ethical committee review, informed consent, and the protection of human subjects participating in biomedical research.

Primary: Progression-free Survival (PFS)

End point title	Progression-free Survival (PFS)
End point description: PFS was defined as the time from randomization to the first documented disease progression, or death due to any cause, whichever occurred first. Per Response Criteria in Solid Tumors version 1.1 (RECIST 1.1), progressive disease was defined as at least a 20% increase in the sum of diameters of target lesions, taking as reference the smallest sum on study. In addition to the relative increase of 20%, the sum must also demonstrate an absolute increase of at least 5 mm. Note: The appearance of one or more new lesions was also considered progression. PFS analysis was based on an integrated radiology	

and oncology (IRO) assessment. PFS was not analyzed for the crossover populations. The Intent-to-Treat (ITT) Population consisted of all randomized participants who had measurable disease at baseline. Participants were included in the treatment group to which they were randomized for the efficacy analysis.

End point description:

The best overall response was assessed by independent radiology review using RECIST 1.1 and was recorded from the start of the study treatment until the end of treatment. Response categories included: Complete Response (CR): disappearance of all target lesions; Partial Response (PR): at least a 30% decrease in the sum of diameters of target lesions; Progressive Disease (PD): at least a 20% increase in the sum of diameters of target lesions; and Stable Disease (SD): neither sufficient shrinkage to qualify for PR nor sufficient increase to qualify for PD. Best overall response for the Initial Treatment Period was based on IRO. The analysis population consisted of all randomized participants who had measurable disease at baseline. Participants were included in the initial treatment group to which they were randomized for the efficacy analysis.
