

Clinical trial results:

A Phase III Open, Multicentre Study to Confirm the Safety, Pharmacokinetics and Efficacy of BPL's High Purity Factor X in the Prophylaxis of Bleeding in Factor X Deficient Children Under the Age of 12 Years

Summary

EudraCT number	2012-003093-98
Trial protocol	GB
Global end of trial date	19 October 2016

Results information

Result version number	v1 (current)
This version publication date	26 April 2017
First version publication date	26 April 2017

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	Yes
EMA paediatric investigation plan number(s)	EMA-000971-PIP01-10
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	Yes

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	07 November 2016
Is this the analysis of the primary completion data?	Yes
Primary completion date	19 October 2016
Global end of trial reached?	Yes
Global end of trial date	19 October 2016
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

To assess the efficacy of FACTOR X in the prevention of bleeding when given as routine prophylaxis over 6 months

Protection of trial subjects:

The option of dosing at home, or at a local clinic was given for routine prophylaxis or short-term preventative treatment. Minor bleeds, which did not require additional treatment were allowed to be treated at home.

For the child's convenience, the option was given for some of the unscheduled blood samples to be collected from the patient's home, or school by a trained nurse or phlebotomist trained in the study procedures, or at a local haemophilia clinic.

Background therapy:

The use of antifibrinolytics (e.g. tranexamic acid) were permitted under the protocol for minimal use only to support treatment of bleeds.

Evidence for comparator: -

Actual start date of recruitment	20 April 2015
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	United Kingdom: 9
Worldwide total number of subjects	9
EEA total number of subjects	9

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	9

Adolescents (12-17 years)	0
Adults (18-64 years)	0
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

Subject recruitment was in the United Kingdom only across 3 centres.

The first subject was screened for the study on the 08 April 2015 and enrolled on the 20 April 2015.

The last subject was screened for the study on the 17 February 2016 and enrolled on the 18 March 2016.

The last patient last visit was on the 19 October 2016.

Pre-assignment

Screening details:

There were no screen failures. Baseline Visit took place within 4 weeks of the Screening Visit as per the protocol.

Screening included the following medical assessments; Demography, updated medical history including bleed history and history of exposure to blood products, physical examination including height and weight, vital signs, blood samples

Period 1

Period 1 title	Overall Trial (overall period)
Is this the baseline period?	Yes
Allocation method	Non-randomised - controlled
Blinding used	Not blinded

Arms

Arm title	FACTOR X
-----------	----------

Arm description:

There was only one treatment arm. All subjects were administered FACTOR X product.

Arm type	Experimental
Investigational medicinal product name	FACTOR X
Investigational medicinal product code	FACTOR X
Other name	Coagadex
Pharmaceutical forms	Concentrate and solvent for solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

FACTOR X contains a nominal 100 IU/mL human coagulation factor X when reconstituted in Water for Injections.

The initial dose at the Baseline Visit was a recommended 50 IU/kg of FACTOR X.

The second dose of FACTOR X (40-50 IU/kg recommended, was given 72 hours (\pm 2 hours) after the Baseline Visit (Day 4).

For children in the 0-5 year age group, at the Investigator's discretion, the second dose of FACTOR X may have been given at 48 hours (\pm 2 hours) after the Baseline Visit (Day 3), if considered necessary to maintain the minimum trough level.

There was a dose adjustment period of up to 6 weeks, thereafter a dosage regimen of 40-50 IU/kg twice a week was recommended, but was not mandatory. Treatment was to be given no more frequently than every 48 hours.

Recommended doses for bleeding episodes was 25 IU/kg for a minor bleed and 50 IU/kg for a major bleed, repeated as often as required based on the FX:C recovery levels and clinical need.

Number of subjects in period 1	FACTOR X
Started	9
Completed	9

Baseline characteristics

Reporting groups

Reporting group title	Overall Trial
Reporting group description: -	

Reporting group values	Overall Trial	Total	
Number of subjects	9	9	
Age categorical			
Subjects fell into 2 age groups, 0-5 years and 6-11 years			
Units: Subjects			
Children 2-11 years	9	9	
Gender categorical			
Units: Subjects			
Female	5	5	
Male	4	4	
Risk Category At Study Entry			
Descriptive statistics were to be presented on the number and percentage of subjects experiencing major and minor bleeds and episodes of excessive bleeding following injury, by risk category of break-through bleeding. Low risk subjects had all the following criteria: <ul style="list-style-type: none">• had been on routine prophylaxis for at least one year immediately prior to study entry.• experienced no more than one minor spontaneous bleeding episode (other than gum bleeds or bruising), requiring clinical assessment during the past year.• experienced no major spontaneous bleeds during the past year			
Units: Subjects			
Risk Category At Study Entry	9	9	
Ethnicity			
Demographic data, including and ethnic origin was to be summarised. All subjects were described as 'not Hispanic or Latino'.			
Units: Subjects			
Ethnicity	9	9	
Factor X Deficiency Diagnosis			
Baseline characteristics, including historical disease data and diagnostic information was summarised as appropriate.			
Units: IU/dL			
median	1.7		
full range (min-max)	1 to 5	-	
Lowest factor X Result			
Baseline characteristics, including historical disease data and diagnostic information was to be summarised as appropriate.			
Units: IU/dL			
median	1		
full range (min-max)	1 to 4	-	

Subject analysis sets

Subject analysis set title	Per-Protocol
Subject analysis set type	Per protocol

Subject analysis set description:

All subjects who had completed a minimum of 6 months (26 weeks) treatment and a minimum of 50 exposure days.

Subject analysis set title	Safety/ITT
Subject analysis set type	Safety analysis

Subject analysis set description:

All unique subjects who received at least one dose of study medication. For this analysis the data for the 1st and 2nd treatment cycles for the re-screened subjects were merged as they are the same patient, i.e. 01-001 was merged with data for subject 01-007, and data for subject 01-003 was merged with 01-008.

Subject analysis set title	Safety/ITT treatment cycle
Subject analysis set type	Intention-to-treat

Subject analysis set description:

Included data for all treatment cycles, where the data for the 2 re screened subjects was not be merged, and was presented separately.

Reporting group values	Per-Protocol	Safety/ITT	Safety/ITT treatment cycle

occurrences (all)	2		

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
27 March 2013	Protocol amendment 1 included the following changes: Removal of references to user kits as they are not to be provided for this study. Site will use their own administration supplies.
24 November 2014	Protocol Amendment 2 included a re-write of the study protocol to reduce the study duration, reduce the number of subjects, and reduce the number of sample collection: Administrative changes to BPL personnel, reduced length of study duration from 12 months to 6 months. Inclusion of the term 'retrospective' to the study to enable collection of retrospective FACTOR X use. Adjustment to study design with respect to blood sampling at the baseline visit as follows; 'sample for inhibitor assessment will be collected and only tested if a later sample is positive for inhibitors. Blood samples for factor x activity analysis will be collected pre-dose and at 30 min (+5 min) post-dose for an incremental recovery assessment'. Reduction of the maximum number of children enrolled from 16 to 12.
22 April 2015	Protocol Amendment 3 included the following changes: Additional detail to be collected in the CRF for surgical procedures as follows; name of surgical procedure and surgical technique whether it is a planned or an emergency surgery indication for surgery surgery start and end dates and times extubation date and time date and time post-operative bleeding stabilised discharge date date of last dose of FACTOR X to treat post-operative bleeding number of swabs and pads used whether there were any unusual features of the surgery or complications which might influence bleeding at the time of surgery or later blood loss compared to a patient without a haemostatic disorder undergoing the same type of surgery (more than, equal to, or less than) whether there was excessive bleeding during surgery relevant laboratory assessments FACTOR X infusions administered Deletion of the following text 'For children who turn 6 years old during the study, an assent form is expected to be completed to confirm the child's continued eligibility for the trial' and instead replaced with 'The child will be provided with written information. If considered appropriate by the investigator, an assent will be obtained using the 8-11 year old Assent Form' and 'For children aged 4-7 years if considered appropriate by the investigator, assent will be obtained using the 4-7 year old Assent Form'. Deletion of the following test relating to additional testing if subjects test positive for Parvovirus 'In addition, children who are negative for Parvovirus B19 IgG and IgM at the Baseline Visit will attend the hospital or a local clinic for an additional blood test 7 days after the Baseline Visit.' Text was deleted as there is no strong scientific rationale or regulatory requirement for children to have this additional test. Text added to clarify when an SAE report needs to be completed in case of a planned surgery e.g. if the underlying condition caused the prolonged hospitalisation.
24 August 2015	Protocol Amendment 4 included the following changes: I. Redefinition of factor X severity II. Clarify reporting of laboratory results as adverse events III. Updated Appendix VIII – Trial Plan Flow Chart IV. Clarification of bleeding assessments V. Administrative changes

13 November 2015	<p>Protocol Amendment 5 included the following changes: Addition to the protocol title to include 'Prophylaxis of Bleeding in'. Additional text regarding re-enrollment of subjects who have completed the study early as follows 'Children may be re-consented and re-enrolled in to the study following case by case evaluation and agreement between the Sponsor and the Co-ordinating Investigator. In such cases, children will be assigned a new patient number and treated as new subjects who must repeat all trial procedures from Screening Visit to End of Study Visit'. Additional wording to the primary objective to include 'reduction' as well as 'prevention' of bleeding.</p> <p>Additional text on laboratory sampling to state that a sample for inhibitor assessment will be collected and only tested if, for example, there is a clinical suspicion of inhibitor development or a later sample is positive for inhibitors.</p>
