Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	31 October 2014
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	12 September 2014
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

Estimation of the effects of GSK239512 on lesion remyelination in subjects with Relapsing Remitting Multiple Sclerosis on stable treatment with Avonex [interferon-beta1a] or Copaxone [glatiramer acetate].

Protection of trial subjects:

A 4-week flexible titration period was used to achieve the final dose for each participant to minimize the occurrence of adverse events. In addition, participants were permitted to down-titrate during the maintenance period, if they experienced tolerability issues.

This study did not require participants to return to the study site for evaluation of relapses, if they chose to go to their local physician. This study did not restrict the use of rescue medications (e.g. glucocorticoids) to manage the occurrence of a relapse. However, due to the potential interference with the MRI, if a relapse requiring management with glucocorticoids occurred around the time of a scheduled MRI, the MRI was to be rescheduled to ensure that the subject has a minimum of a 1 week washout period following completion of treatment with glucocorticoids.

The study included flexible visit day scheduling to allow inclusion of holiday periods over the 1 year duration with intensive visit schedule.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	01 February 2013
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Spain: 23
Country: Number of subjects enrolled	Sweden: 1
Country: Number of subjects enrolled	United Kingdom: 9
Country: Number of subjects enrolled	Bulgaria: 12
Country: Number of subjects enrolled	Czech Republic: 4
Country: Number of subjects enrolled	Germany: 26
Country: Number of subjects enrolled	Canada: 5
Country: Number of subjects enrolled	Ukraine: 51
Worldwide total number of subjects	131
EEA total number of subjects	75

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	131
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details: -

Pre-assignment

Screening details:

Participants (par.) diagnosed with a relapsing-remitting multiple sclerosis (RRMS) on stable background treatment with either avonex or copaxone were eligible to participate.

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Monitor, Data analyst, Carer, Assessor

Arms

Are arms mutually exclusive?	Yes
Arm title	Placebo QD

Arm description:

Participants received GSK239512 matching placebo tablets orally once daily (QD) during the 4 week titration period followed by the 44 week treatment maintenance period. The treatment period could be adapted to a 5 week titration and 43 week maintenance period, if needed. A single down-titration was allowed during the maintenance period if MTD was lower than the maximum dose achieved during titration. Participants continued with their current standard of care background disease modifying therapy (DMT) of either avonex or copaxone throughout the study.

Arm type	Placebo
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Placebo - 10 µg, 20 µg, 40 µg, or 80 µg once daily

Arm title	GSK239512 QD
------------------	--------------

Arm description:

Participants received titration doses of GSK239512 tablets orally QD, starting at 10 micrograms (µg) and increased up to 80 µg during the 4 week titration period (10 µg first week, 20 µg second week, 40 µg third week, 80 µg fourth week) in order to select the maximum tolerated dose (MTD). Participants continued on the MTD of GSK239512 during the 44 week treatment maintenance period. The treatment period could be adapted to a 5 week titration and 43 week maintenance period, if needed. A single down-titration was allowed during the maintenance period if MTD was lower than the maximum dose achieved during titration. Participants continued with their current standard of care background DMT of either avonex or copaxone throughout the study.

Arm type	Experimental
Investigational medicinal product name	GSK239512
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

10 µg, 20 µg, 40 µg, or 80 µg once daily

Primary: Mean change in gadolinium enhanced (GdE) lesion magnetization transfer ratio (MTR) value post-Lesion (PoL) from pre-Lesion (PrL)

End point title	Mean change in gadolinium enhanced (GdE) lesion magnetization transfer ratio (MTR) value post-Lesion (PoL) from pre-Lesion (PrL)
-----------------	--

End point description:

Brain magnetic resonance imaging (MRI) scans were performed to assess MTR values for gadolinium GdE lesions. GdE lesions are areas of inflammation detected by injecting GdE. Changes in MTR values are indicative of changes in brain myelin content associated with lesion remyelination. MRI scans were performed at Baseline, Weeks 6, 12, 18, 24, 30, 36, 42 and 48. The change in MTR value PoL from PrL was the change in the average PoL MRI scans MTR from the average PrL MRI scans MTR. The analysis method used was the mixed-model repeated measures (MMRM) adjusted for treatment, relative MRI, lesion volume, background MS DMT, average PrL MTR, and treatment, lesion volume, background DMT and average PrL MTR all by relative MRI. Analysis excluded MRI scans within 70 days of lesion occurrence and included data for lesions with at least 2 MRI assessments PrL and PoL. Intent-to-Treat (ITT) Population: par. who received ≥ 1 dose of investigational product post randomization.

Secondary: Change from Baseline in T2 lesion MTR at Week 48

End point title	Change from Baseline in T2 lesion MTR at Week 48
-----------------	--

End point description:

Brain MRI scans were performed to assess MTR of T2 lesions, which is indicative of brain myelin content. Changes in MTR values are indicative of changes in brain myelin content associated with lesion remyelination. T2 lesions are also called hyperintense lesions, meaning that they appear as bright spots on the MRI image. Baseline was defined as the participant's last available assessment prior to initiation of study medication. Change from Baseline was calculated as the Week 48 value minus the Baseline value. The analysis method was MMRM adjusted for treatment, visit, screening T2 lesion MTR value, background MS DMT, treatment by visit, screening T2 lesion MTR value by visit and background DMT by visit.

Secondary: Change from Baseline in whole brain volume at Week 48

End point title	Change from Baseline in whole brain volume at Week 48
-----------------	---

End point description:

Whole brain volume is a measure of brain size determined by a MRI scan. Baseline is defined as the participant's last available assessment prior to initiation of study medication. The normalized brain volume at Week 48 was derived from the dataset presenting change from baseline as follows: Week 48 Volume = Baseline Volume plus (Baseline Volume x Relative Change at Week 48). The analysis was performed by the analysis of covariance adjusted for treatment, screening brain volume, and background MS DMT. The observed case (OC) dataset was used which contained all the available change from Baseline responses for each participant without missing values being estimated or data carried forward.

End point title	Change from Baseline (BL) in CogState battery total score (TS), executive function composite score (EFCS), memory composite score (MCS) and attention composite score (ACS) at Week 48
-----------------	--

End point description:

The CogState battery used in this study consists of 7 tasks for which multiple outcome measures are collected and used in the derivation of the composite cognitive domain scores. Test scores were interpreted on the basis of normative data and expected level of performance. The assessment was conducted at Screen (twice), BL, and Weeks 12, 24 and 48. Change from BL in TS, EFCS, MCS and ACS is summarised at Week 48. The BL is the mean of the second Screening assessment and the BL (pre-dose) assessment, if both were avail or the non-missing value if only one was avail. Change from BL is calculated as post-BL value minus BL value. The analysis method was MMRM adjusted for treatment, visit, BL executive function score, background MS DMT, and interaction by visit. Only those par. available at specified time points were analyzed. Different par. may have been analyzed at different time points, so the overall number of par. analyzed reflects everyone in the ITT Population.

Secondary: Relapse rate during the treatment phase

End point title	Relapse rate during the treatment phase
End point description:	
A relapse is defined as participant-reported symptoms or objectively observed signs typical of an acute inflammatory demyelinating event in the central nervous system (CNS). It must occur in the absence of fever or infection and should follow improvement from a previous relapse, occur at least 30 days following the onset of a previous relapse, and be persistent for at least 24 hours. The analysis method was a maximum likelihood based analysis, assuming the Negative Binomial distribution with time on treatment measured in days as an offset variable for relapse occurrence. The model included adjustment for background DMT and treatment.

Notes:

[39] - Treatment Comparison Odds Ratio (GSK239512/Placebo). A ratio <1 indicates a lower risk with GSK239512 compared with placebo.

Secondary: Analysis of the time to first relapse

End point title	Analysis of the time to first relapse
-----------------	---------------------------------------

End point description:

A relapse is defined as participant-reported symptoms or objectively observed signs typical of an acute inflammatory demyelinating event in the central nervous system (CNS). It must occur in the absence of fever or infection and should follow improvement from a previous relapse, occur at least 30 days following the onset of a previous relapse, and be persistent for at least 24 hours. Date of relapse was captured for each subject and occurrence, if a relapse occurred. Time to first relapse was calculated as the relapse onset date minus date study medication was started plus one day. Analysis was performed using a Cox's Proportional Hazards model adjusting for background DMT. A hazard ratio <1 indicates a lower risk with GSK239512 compared with placebo.

Notes:

[103] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.

Justification: This endpoint only applies to the GSK2586184 arm.

End point values	GSK239512 QD			
Subject group type	Reporting group			
Number of subjects analysed	65 ^[104]			
Units: Picograms per milliliter				
arithmetic mean (standard deviation)				
Week 4, 20 ug, n=4	18.228 (± 3.3496)			
Week 4, 40 ug, n=11	40.775 (± 20.0529)			
Week 4, 80 ug, n=48	80.641 (± 49.0002)			
Week 8, 20 ug, n=4	15.21 (± 3.5531)			
Week 8, 40 ug, n=6	30.753 (± 12.4895)			
Week 8, 80 ug, n=52	77.653 (± 41.9646)			
Week 24, 20 ug, n=3	13.627 (± 2.2262)			
Week 24, 40 ug, n=8	40.851 (± 20.0234)			
Week 24, 80 ug, n=44	84.8 (± 54.3398)

Statistical analyses

No statistical analyses for this end point

Secondary: Mean GSK2586184 plasma concentrations at Weeks 8

End point title	Mean GSK2586184 plasma concentrations at Weeks 8 ^[105]
-----------------	---

End point description:

Pharmacokinetic (PK) samples were collected for all participants on Weeks 8 at pre dose, 0.5 hour (H), 2

H and 6 H post dose (20 µg, 40 µg and 80 µg) of GSK239512. Only those participants available at the specified time points were analyzed (represented by n=X, X in the category titles). Different participants may have been analyzed at different time points, so the overall number of participants analyzed reflects everyone in the ITT Population.

End point type	Secondary
End point timeframe:	
Week 8	

Notes:

[105] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.

Justification: This endpoint only applies to the GSK2586184 arm.

End point values	GSK239512 QD			
Subject group type	Reporting group			
Number of subjects analysed	65 ^[106]			
Units: Nanograms per milliliter				
arithmetic mean (standard deviation)				
Pre-Dose, 20 ug, n=4	15.21 (± 3.5531)			
Pre-Dose, 40 ug, n=6	30.753 (± 12.4895)			
Pre-Dose, 80 ug, n=52	77.653 (± 41.9646)			
0.5 H, 20 ug, n=4	18.445 (± 0.6193)			
0.5 H, 40 ug, n=8	38.63 (± 13.9641)			
0.5 H, 80 ug, n=49	85.177 (± 50.7385)			
2 H, 20 ug, n=4	51.95 (± 24.1757)			
2 H, 40 ug, n=8	141.891 (± 68.144)			
2 H, 80 ug, n=49	195.431 (± 115.1998)			
6 H, 20 ug, n=4	52.768 (± 17.5052)			
6 H, 40 ug, n=8	103.084 (± 18.7014)			
6 H, 80 ug, n=49	191.989 (± 91.8976)

Adverse events

Adverse events information

Timeframe for reporting adverse events:

Serious adverse events (SAEs) and non-serious adverse events (AEs) were collected from the start of administration of the study drug until the follow-up contact (up to Week 50).

Adverse event reporting additional description:

SAEs and non-serious AEs were reported for members of the ITT population, comprised of all participants who were randomised to treatment, and received at least one dose of study medication.

Assessment type	Systematic
