

Clinical trial results:

The LuMEEn study

177Lu-octreotate treatment outcome prediction using Multimodality imaging in refractory neuroEndocrine tumours

Summary

EudraCT number	2012-003666-41
Trial protocol	BE
Global end of trial date	16 September 2022

Results information

Result version number	v1 (current)
This version publication date	13 October 2024
First version publication date	13 October 2024

Notes:

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	24 August 2023
Is this the analysis of the primary completion data?	Yes
Primary completion date	20 May 2022
Global end of trial reached?	Yes
Global end of trial date	16 September 2022
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

For each lesion: To assess the value of the following parameters (obtained through functional and molecular imaging) for predicting the lesion-by-lesion PRRT treatment outcome:

- 18FDG uptake on 18FDG PET/CT,
 - 68Ga-octreotate uptake on 68Ga-octreotate PET/CT,
 - Apparent Diffusion Coefficient on Diffusion Weighted-MRI,
- [for these three parameters, absolute values at baseline will be assessed]
- Tumor dosimetry on post-177Lu-octreotate SPECT/CT after the first cycle.

Protection of trial subjects:

a nephroprotective perfusion of an amino acid solution was simultaneously administered with the 177Lu-octreotate injection. This nephroprotective perfusion was preceded by the administration of an anti-emetic regiment to prevent nausea or vomiting from the amino acids.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	25 July 2013
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Belgium: 37
Worldwide total number of subjects	37
EEA total number of subjects	37

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0

Adults (18-64 years)	13
From 65 to 84 years	24
85 years and over	0

Subject disposition

Recruitment

Recruitment details: -

Pre-assignment

Screening details:

Screening procedures were done within 4 weeks before the first ¹⁷⁷Lu-octreotate injection.

Period 1

Period 1 title	Treatment (overall period)
Is this the baseline period?	Yes
Allocation method	Not applicable
Blinding used	Not blinded

Arms

Arm title	77Lu-octreotate
------------------	-----------------

Arm description:

This treatment consisted of ¹⁷⁷Lu-octreotate injections(4 cycles) in fixed activities of 7,4GBq (200 mCi) ($\pm 5\%$) each, given 12 weeks (± 1 week) apart, injected intravenously, simultaneously with nephroprotective perfusion of an amino acid solution.

Arm type	Experimental
Investigational medicinal product name	Lu-octreotate
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Radiopharmaceutical precursor, solution
Routes of administration	Injection

Dosage and administration details:

(4 cycles) in fixed activities of 7,4GBq (200 mCi) ($\pm 5\%$) each, given 12 weeks (± 1 week) apart, injected intravenously, simultaneously with nephroprotective perfusion of an amino acid solution

Number of subjects in period 1	77Lu-octreotate
Started	37
Completed	28
Not completed	9
Consent withdrawn by subject	3
Second primary malignancy	2
Disease progression	2
Death	1
Lost to follow-up	1

End points

End points reporting groups

Reporting group title	77Lu-octreotate
Reporting group description: This treatment consisted of 177Lu-octreotate injections(4 cycles) in fixed activities of 7,4GBq (200 mCi) ($\pm 5\%$) each, given 12 weeks (± 1 week) apart, injected intravenously, simultaneously with nephroprotective perfusion of an amino acid solution.	

Primary: Lesion time to progression (TTP) (lesion-based analysis)

End point title	Lesion time to progression (TTP) (lesion-based analysis) ^[1]
End point description: 116 target lesions. 84 out of 116 were considered evaluable. 1) 18FDG PET/CT imaging: No significant association with the lesion morphological outcome was observed for any of the 18FDG PET baseline parameters. 2) 68Ga-DOTATATE PET/CT imaging: Baseline SUVmax, SUVmean, tumour-to-blood ratio, SSTR-TV and total lesion SSTR expression were not associated with the lesion morphological outcome. 3) dwMR imaging: In 62 morphologically evaluable lesions, no association was found between baseline ADC and lesion outcome ($p=0.58$).	

End point type	Primary
End point timeframe: Median follow-up time for all subjects (data analysis in July 2022) was 57 months (95%CI: 50-71), during which the median lesion-based TTP was not reached.	

Notes:

[1] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: This is a single arm study.

End point values	77Lu-octreotate			
Subject group type	Reporting group			
Number of subjects analysed	37 ^[2]			
Units: evaluable target lesions				
complete response	0			
partial response	22			
stable	50			
progression	12			

Notes:

[2] - 84 evaluable target lesions

Statistical analyses

No statistical analyses for this end point

Secondary: objective response (patient-based analysis)

End point title	objective response (patient-based analysis)
End point description:	
End point type	Secondary
End point timeframe: The median follow-up time (data cutoff, July 2022) was 57 months (95% CI, 50-71 months).	

End point values	77Lu-octreotate			
Subject group type	Reporting group			
Number of subjects analysed	37 ^[3]			
Units: number of patients				
complete response	0			
partial response	11			
stable disease	24			
progression	2			

Notes:

[3] - 37 treated patients

Statistical analyses

No statistical analyses for this end point

Secondary: Progression-free survival

End point title	Progression-free survival
End point description:	
<p>Patients with pancreatic primary NETs had a shorter PFS (median, 19.4 months) than that of patients with intestinal NETs (29.5 months) (P-value=0.01; HR,2.96; 95% CI, 1.25–7.02). 1) 68Ga-DOTATATE PET/CT: An SSTR TV decrease of more than 10% from baseline after C1 discriminated patients with a significantly longer median PFS (51.3 months) than that (22.8 months) of patients for whom SSTR TV increased or decreased by less than 10% (P-value=0.003; HR, 0.35; 95% CI, 0.16–0.75). 2) 18F-FDG PET/CT. Quantification of baseline 18F-FDG PET/CT was available for only 10 patients. Because of the low number of patients and events, no statistical analysis for association with patient outcome was performed. 3) Diffusion-Weighted MRI: In 29 patients followed by MRI, there was no statistical evidence of an association between baseline ADC or its relative change after C1 and patient outcome.</p>	
End point type	Secondary
End point timeframe:	
Median follow-up: 57 months	

End point values	77Lu-octreotate			
Subject group type	Reporting group			
Number of subjects analysed	37 ^[4]			
Units: months				
median (inter-quartile range (Q1-Q3))	28.1 (21.7 to 48.1)			

Notes:

[4] - treated patients

Statistical analyses

No statistical analyses for this end point

Secondary: tumor dosimetry

End point title	tumor dosimetry
End point description:	
83 target lesions: The median absorbed dose in C1 was 33Gy (IQR, 22–50 Gy) and declined from the first to the last treatment cycles, reaching significance between C1 and cycle 3 (P-value=0.002), C1 and cycle 4 (P-value<0.001), and cycles 2 and 4 (P-value=0.01). A significant correlation between tumor-absorbed C1 dose and lesion outcome was demonstrated for larger lesions ($\geq 22\text{mm}$) and for the limited number of lesions of colorectal primary NET origin. On a patient level, the minimal absorbed dose per target lesion in C1 ranged from 10 to 77Gy. An optimal cutoff of 35Gy (i.e., patients in whom all target lesions received at least a 35-Gy tumor-absorbed C1 dose) discriminated patients with a significantly longer median PFS (48.1 months) than that of patients in whom at least 1 target lesion was treated with less than 35Gy in C1 (26.2 months) (P-value=0.02; HR, 0.37; 95% CI, 0.17–0.82).	
End point type	Secondary
End point timeframe:	
absorbed dose in C1 (cycle 1)	

End point values	77Lu-octreotate
