

Clinical trial results:

A three-arm, randomized, open label, phase II study of everolimus in combination with exemestane versus everolimus alone versus capecitabine in the treatment of postmenopausal women with estrogen receptor positive, locally advanced, recurrent, or metastatic breast cancer after recurrence or progression on prior letrozole or anastrozole

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	30 July 2018
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	30 July 2018
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary objective was to estimate the hazard ratio (HR) of progression free survival (PFS) for everolimus plus exemestane versus everolimus alone in postmenopausal women with ER-positive, HER2-negative, advanced breast cancer after recurrence or progression on letrozole or anastrozole.

Protection of trial subjects:

The study was in compliance with the ethical principles derived from the Declaration of Helsinki and the International Conference on Harmonization (ICH) Good Clinical Practice (GCP) guidelines. All the local regulatory requirements pertinent to safety of trial subjects were also followed during the conduct of the trial.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	26 February 2016
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

85 years and over	2

Subject disposition

Recruitment

Recruitment details:

This study was conducted at 84 centers in 18 countries worldwide: Belgium (1), Denmark (6), Hungary (3), Ireland (3), Spain (4), Sweden (6), United Kingdom (3), United States (19), Argentina (6), Brazil (5), Peru (4), India (4), Lebanon (5), Malaysia (2), Russia (3), Thailand (3), Turkey (3) Australia (4)

Pre-assignment

Screening details:

A total of 300 subjects were planned and total of 309 subjects were randomized to everolimus plus exemestane (control arm) (N = 104), everolimus alone (N = 103), or capecitabine (N = 102).

Period 1

Period 1 title	Treatment Phase
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	Everolimus 10 mg + Exemestane 25 mg

Arm description:

Everolimus (10 mg daily) with Exemestane (25 mg daily) (control arm).

Arm type	Active comparator
Investigational medicinal product name	Everolimus
Investigational medicinal product code	
Other name	RAD001
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Everolimus, 5 mg tablets for oral use, 10 mg (2 x 5 mg) per day (centrally supplied)

Investigational medicinal product name	Exemestane
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Exemestane, tablets for oral use, 25 mg per day in (locally supplied)

Arm title	Everolimus 10 mg

Primary: Progression Free Survival (PFS) - Everolimus plus exemestane versus everolimus alone

End point title	Progression Free Survival (PFS) - Everolimus plus exemestane versus everolimus alone ^[1]
End point description: Progression Free Survival (PFS) is defined as the time from date of randomization to the date of first radiologically documented progression or death due to any cause. If a patient did not have an event, PFS was censored at the date of the last adequate tumor assessment. PFS was compared between the everolimus + exemestane combination therapy with the everolimus monotherapy.	
End point type	Primary
End point timeframe: Date of randomization to the date of first documented tumor progression or death from any cause, whichever occurs first, reported between day of first patient randomized up to 39 months	

Notes:

[1] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period. Justification: Primary endpoint "Progression Free Survival (PFS) - Everolimus plus exemestane versus everolimus alone" only apply to Treatment Arms: "Everolimus 10 mg + Exemestane 25 mg" and "Everolimus 10 mg"

Post-hoc: All collected deaths

End point title	All collected deaths
End point description:	
On treatment deaths were collected from FPFT up to 30 days after study drug discontinuation, for a maximum duration of 224 weeks (treatment duration ranged from 1.3 to 220.0 weeks). Deaths post treatment survival follow up were collected after the on- treatment period, up to approximately 5 years. Patients who didn't die during the on-treatment period and had not stopped study participation at the time of data cut-off (end of study) were censored.	
End point type	Post-hoc
End point timeframe:	
up to 224 weeks (on-treatment), up to approximately 5 years (study duration)	

End point values	Everolimus 10 mg + Exemestane 25 mg	Everolimus 10 mg	Capecitabine 1250 mg/m2	
Subject group type	Reporting group	Reporting group	Reporting group	
Number of subjects analysed	104	103	102	
Units: Participants				
On-treatment deaths	9	5	2	
Post-treatment deaths	62	55	57	
All deaths	71	60	59

Adverse events

Adverse events information

Timeframe for reporting adverse events:

Adverse Events are collected from First Patient First Visit (FPFV) until Last Patient Last Visit (LPLV). All Adverse events are reported in this record from First Patient First Treatment until Last Patient Last Visit.

Adverse event reporting additional description:

Consistent with EudraCT disclosure specifications, Novartis has reported under the Serious adverse events field "number of deaths resulting from adverse events" all those deaths, resulting from serious adverse events that are deemed to be causally related to treatment by the investigator.

Assessment type	Systematic

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
25 June 2013	Amendment 1 was issued when four subjects were randomized, six subjects were in screening and one subject was discontinued due to disease progression. The main purpose of amendment 1 was to introduce the following changes: 1) A new exclusion criterion was added to exclude subjects who were being treated with sorivudine or its chemically related analogues (e.g. brivudine) or it was required to have at least 4 weeks period between end of treatment with such drugs and randomization date. 2) To be consistent with exclusion criterion 20 (re-numbered as 18 after amendment), which excluded subjects under coumarin-derivate anticoagulants, the exclusion criterion 15 was updated to also exclude subjects under low dose warfarin treatment. 3) Besides the pre-specified final OS analysis, it was desirable to assess the treatment effect on overall survival at the time of the pre-specified final PFS analysis. So this interim OS analysis was added in the amendment. No multiple testing considerations were needed because hypothesis testing was not part of either OS analysis.
16 June 2014	Amendment 2 was issued when 119 subjects were randomized. The main purpose of amendment 2 was to introduce the following change: • An interim analysis was added to allow early termination of the everolimus monotherapy arm when approximately 75 PFS events had been observed as per local tumor assessment, across the two arms: everolimus monotherapy and everolimus + exemestane combination arm. The intent of adding this interim analysis was to allow for the potential of early termination of the everolimus monotherapy arm, in case the efficacy in the everolimus monotherapy arm was far inferior to the everolimus + exemestane combination arm. This approach was endorsed by the Data Monitoring Committee (DMC) and Study Steering Committee.
18 April 2017	Amendment 3 was issued when study was fully recruited with 309 subjects, with the last subject randomized on 24-Nov-2014. Per initial protocol, the final PFS analysis was to be performed when at least 150 PFS events have been documented in 1) everolimus plus exemestane arm, and everolimus monotherapy arm, and 2) the everolimus plus exemestane arm, and capecitabine monotherapy arm. The OS analyses were to be conducted with two data cut-off dates; 2 years after the last subject's randomization and at the time of the final PFS analysis. Based on the observed 146 PFS events, there were 4 events less in one of the comparison, and there was a high risk of not reaching the events over extended time due to long lasting stable disease status in the remaining subjects. From the statistical perspective, loss of precision in the HR estimate with ≤ 4 events short of required 150 was considered minimal. In order to meet the regulatory commitment for submitting the CSR without affecting the scientific objective of the study, it was proposed in the protocol amendment 3 to: 1) Perform the final PFS analysis after approximately (instead of at least) 150 PFS events have been documented for each comparison. 2) Perform the final OS analysis at the same time as the final PFS analysis using the same data cut-off date. This amendment was considered "non-substantial" as it did not affect the subject management or the statistical analyses of the study.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats
