Analysis stage	Final
Date of interim/final analysis	13 September 2019
Is this the analysis of the primary completion data?	No

Global end of trial reached?	Yes
Global end of trial date	01 August 2018
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary endpoint of the study is the proportion of patients who lose MMR during the trial observation period of 37 months. BCR-ABL1 will be assessed by standard PCR based molecular monitoring on blood. This is a routine part of clinical follow-up, but will be carried out more frequently than usual. It is not expected that any patient will undergo more serious relapse than loss of MMR, so there are no formal plans for routine marrow examinations. MR4 and MMR patients will receive the same strategy, but will be analysed separately.

Protection of trial subjects:

The study involved a de-escalation of patient's prescribed medication for CLL, followed by stopping of their medication. As part of analysis, and as a continuous indication of patient health, monthly bloods were taken and analysed for relapse.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	01 June 2013
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	United Kingdom: 174
Worldwide total number of subjects	174
EEA total number of subjects	174

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0

Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	111
From 65 to 84 years	62
85 years and over	1

Subject disposition

Recruitment

Recruitment details:

The trial opened to recruitment in December 2013 and closed in April 2015. Although the target number of patients was 168, 174 patients were enrolled in the study. This was due to ethical reasons as patients at different sites were still in the process of joining when the trial was approaching recruitment termination.

Pre-assignment

Screening details:

A total of 336 patients were screened for the trial. Main reasons for decline included the commitment to monthly visits, the additional bone marrow test and reduction/cessation of treatment dose. Main reasons for exclusion included inadequate PCR lab results and higher or lower TKI doses than required.

Period 1

Period 1 title	Baseline
Is this the baseline period?	Yes
Allocation method	Non-randomised - controlled
Blinding used	Not blinded

Arms

Arm title	De-escalation
Arm description: -	
Arm type	De-escalation
Investigational medicinal product name	Imatinib
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Film-coated tablet
Routes of administration	Oral use

Dosage and administration details:

200mg once daily

Investigational medicinal product name	Nilotinib
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Capsule, hard
Routes of administration	Oral use

Dosage and administration details:

200mg twice daily

Investigational medicinal product name	Dasatinib
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Film-coated tablet
Routes of administration	Oral use

Dosage and administration details:

50mg once daily

Number of subjects in period 1	De-escalation
Started	174
Completed	174

Period 2

Period 2 title	De-escalation
Is this the baseline period?	No
Allocation method	Non-randomised - controlled
Blinding used	Not blinded

Arms

Arm title	De-escalation
Arm description: -	
Arm type	De-escalation
No investigational medicinal product assigned in this arm	

Number of subjects in period 2	De-escalation
Started	174
Completed	159
Not completed	15
Relapse	10
Study drop-out	5

Period 3

Period 3 title	Cessation
Is this the baseline period?	No
Allocation method	Non-randomised - controlled
Blinding used	Not blinded

Arms

Arm title	De-escalation
Arm description: -	
Arm type	De-escalation
No investigational medicinal product assigned in this arm	

Number of subjects in period 3^[1]	De-escalation
Started	153
12 month cessation	103
Completed	94
Not completed	59
Relapse	54
Study drop-out	5

Notes:

[1] - The number of subjects starting the period is not consistent with the number completing the preceding period. It is expected the number of subjects starting the subsequent period will be the same as the number completing the preceding period.

Justification: 4There were 6 patients (4 MMR and 2 MR4) that completed 12 months of de-escalation although they did not start cessation phase. The summaries in brackets refer to those patients.

Baseline characteristics

Reporting groups

Reporting group title	Baseline
-----------------------	----------

Reporting group description:

Baseline patients are summarised for the full cohort of 174 recruited patients.

Reporting group values	Baseline	Total

Primary: Relapse rate

End point title	Relapse rate ^[1]
End point description:	
The proportion of patients who can first de-escalate their treatment (to half the standard dose of their TKI) for 12 months, and then stop treatment completely for a further 2 years, without losing MMR. Losses to follow-up and complete withdrawals (prior experiencing relapse) from the trial are excluded from the number of available patients for analysis.	
End point type	Primary
End point timeframe:	
Relapses are recorded from start of de-escalation phase until end of treatment cessation phase (3 years in total).	

Notes:

[1] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: The website features do not allow the specify the primary endpoint analysis. No p-value was calculated but percentage estimate with 90% confidence interval, separately for the two subgroups.

End point values	MMR	MR4

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
03 February 2014	<ul style="list-style-type: none">• Clarification that reporting of molecular results should be to International Standard where possible and that potential patients without a standard BCR-ABL1 fusion transcript only may be eligible to participate.• The criterion that excludes patients with previous higher than standard dose has been modified to include an exception to allow higher dose patients that participated in specific studies to be included as they do not demonstrate resistant disease.• Clarification that patients who are already being treated with lower doses for tolerance reasons are allowed, providing their current dosage is at least 50% of the defined standard dose.• Running order of exclusion criteria changed as result of the changes to allow a better reading 'flow'.• Clarification that samples should continue to be collected for relapsed patients until the molecular result at study entry is regained.• Rewording for clarity of the primary endpoint.• The line on there being no routine marrow examinations removed.• Sample section has been updated so only patients recruited and treated at the Royal Liverpool Hospital are requested to provide blood samples for sending to the Liverpool labs.• Sample collection time-points clarified and receptacles to be used, plus kits that are provided have been updated• Additional samples from diagnostic blood tests being sent to Hammersmith has been updated to include all patients, rather than just those from the MR4 group, and clarified in the samples table.• Accountability Procedures for Trial Treatment section has been re-written to confirm that the Trial is a 'Type A' and that no accountability is required.• Confirmation that other treatment supply practices are allowed if the PI approves.• Post month 37 PCR results (i.e. local) also being required has been added to this section• Confirmation that enrolment to each molecular group will cease when its required number is reached added.
18 December 2014	<p>Molecular Grouping:</p> <ul style="list-style-type: none">• Deletion of statement 'Enrolment to each molecular group will cease once the required number of patients for that particular group has been reached.'• Reference to 2 equal groups of 84 MMR and MR4 patients removed throughout and replaced with 1 group of 168 MMR and MR4.

16 January 2015	<ul style="list-style-type: none"> • Clarification that the central analysis definition of MMR is a BCR-ABL1/ABL1 ratio of $\leq 0.1\%$ to International Standards (IS) • Clarification that samples should continue to be collected for relapsed patients until MMR is regained • Addition of extra medical expert who will assess SAE reports • Exclusion criterion expanded to cover prior use of interferon • 'Objectives' renamed 'Outcomes' and the secondary outcomes expanded • Clarification that the study is a phase IIb • Duplicated inclusion and exclusion criteria replaced with instruction to refer to the same in the protocol summary. Section numbering altered as a result. • Updated to allow emailed registrations. • Quantity of marrow tissue required updated to 1-2ml in table 1 to be consistent with rest of section • Clarification that month 37 or relapse marrow samples should still be requested even if a baseline one wasn't available, and that the quantity of marrow should be taken according to local practice • Section re-worded for clarity and reference to 'Type A' trial removed as this is covered in the risk assessment section of the protocol. • Clarified throughout that molecular monitoring is reported to international standards and not just where possible, and that samples should continue to be collected for relapsed patients until MMR is regained • Schedule of trial procedures updated to include Hammersmith alert procedures and weight measurement requirement at all post screening visits • Baseline marrow window extended to 1 calendar month prior to the commencement of de-escalation • Table legend updated accordingly • Addition to clarify that baseline samples are not included in the establishing of relapse • Updated to include the reclassification of MR4 patients for statistical analysis purposes, plus rationale of same. Update to sample size. • Update to analysis plan. • Clarification and expansion in pharmacovigilance section. • Risk assessment categories replaced.
04 July 2016	<ul style="list-style-type: none"> • Update to protocol summary diagram. • Changes to wording in overall design. • Schedule of procedure updated to include relapse procedures.
22 March 2017	<ul style="list-style-type: none"> • Update to diagram in protocol summary. • Removal of bone marrow and 30mls blood at month 37. Addition of follow-up patients after month 37. • Correction to references to Reference Safety Information.
28 May 2018	<ul style="list-style-type: none"> • Removal of one secondary endpoint. • Updated to contact details. • Updated references to SmPCs. Clarified processes for non-protocol dosing. Removed wording relating to licenced indication, dosage and form. Confirmed method of dose reduction.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
