

Clinical trial results:

A randomised, double-blind, placebo-controlled trial for establishing safety, tolerability, pharmacokinetics, pharmacodynamics and clinical efficacy of multiple subcutaneous doses of BI 655064 in healthy volunteers and in rheumatoid arthritis patients with prior inadequate response to methotrexate therapy.

Summary

EudraCT number	2012-004090-16
Trial protocol	DE ES CZ NL
Global end of trial date	27 April 2015

Results information

Result version number	v2 (current)
This version publication date	24 August 2016
First version publication date	08 May 2016
Version creation reason	<ul style="list-style-type: none">• New data added to full data set New data is not added, but a note is deleted from the Limitation and Caveats sections stating that "the PK outcome measures will be adapted as soon as the final report is available". The clinical trial report has been finalized now and no updates are required to the results which were posted earlier.

Analysis stage	Final
Date of interim/final analysis	06 July 2015
Is this the analysis of the primary completion data?	Yes
Primary completion date	02 March 2015
Global end of trial reached?	Yes
Global end of trial date	27 April 2015
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The trial objective was to evaluate safety and systemic and local tolerability of 4 weeks of repeated subcutaneous doses of 80, 120, 180 or 240 mg BI 655064 per week administered to healthy volunteers (HVs; Part 1, Phase Ib), and of 12 weeks of repeated doses of 120 mg BI 655064 per week in patients with rheumatoid arthritis (RA) who had prior inadequate response to methotrexate (MTX) therapy (Part 2, Phase IIa).

Protection of trial subjects:

Prior to the initiation of any trial-related procedure, all patients were informed about the trial verbally and in writing by the investigator. Each patient signed and dated an informed consent form according to Good Clinical Practice (GCP) and local regulatory and legal requirements. Separate informed consent was obtained for pharmacogenomic testing.

The trial had a multi-part design where the progression from one dose group to the higher one was contingent upon the favourable completion of the prior dose group. The accrued trial data were therefore evaluated by an independent Data Monitoring Committee (DMC), which in the absence of safety concerns, could recommend the initiation of the next higher dose group.

Healthy volunteers were exposed to the risks of the trial procedures and trial medication, and did not receive a direct benefit from participation in this trial. However, they were under close medical supervision throughout the trial. Doses of 80 and 120 milligram (mg) BI 655064 were expected to be well tolerated by healthy volunteers. Advancement to the 2 higher doses (180 and 240 mg) was only to be allowed after safety review of the lower doses by the DMC, including preliminary PK assessment and projection of the anticipated exposure to the higher doses.

All patients in Part 2 (Phase IIa) were to remain on background Methotrexate (MTX) for the 12 week period of BI 655064 treatment. Furthermore, therapy with systemic glucocorticoids (GCs) was permitted at up to a maximum dose of 10 mg prednisolone/day (or the equivalent) during the entire period of trial treatment. NSAIDs and analgesics were also permitted at the investigator's discretion. The theoretical risks of thromboembolic events and uncontrolled cytokine release were to be mitigated by close clinical and laboratory monitoring.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	09 January 2013
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

--------------------------------------	-----------------

Country: Number of subjects enrolled	Czech Republic: 16
Country: Number of subjects enrolled	Germany: 15
Country: Number of subjects enrolled	Netherlands: 7
Country: Number of subjects enrolled	Poland: 46
Country: Number of subjects enrolled	Spain: 8
Worldwide total number of subjects	144
EEA total number of subjects	92

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	126
From 65 to 84 years	18
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

The study included a part 1 (Phase Ib multiple rising dose) where 40 healthy volunteers were recruited, in 4 sequential groups of 10 subjects (8 of them received active drug, 2 placebo) each. Thereafter a part 2 (Phase 2a) was conducted. 67 patients with RA and who had prior inadequate response to MTX treatment were randomised into 2 arms.

Pre-assignment

Screening details:

All subjects were screened for eligibility to participate in trial. Subjects attended specialist sites to ensure that they (the subjects) met all implemented inclusion/exclusion criteria. Subjects were not to be randomised to trial drug if any of the specific entry criteria was violated.

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Investigator, Subject, Monitor, Data analyst, Carer, Assessor

Blinding implementation details:

This study was a Randomised, placebo controlled and double blinded.

Arms

Are arms mutually exclusive?	Yes
Arm title	Part 1, Placebo BI 655064 80/120mg (HV)

Arm description:

Part 1, Healthy volunteers (HV): Placebo matching BI 655064 80 or 120 milligram (mg) injected subcutaneous on days 1, 8, 15, and 22 (once weekly, for 4 weeks) followed by 6 weeks follow-up period.

Arm type	Placebo
Investigational medicinal product name	Placebo
Investigational medicinal product code

Notes:

[1] - The number of subjects reported to be in the baseline period are not the same as the worldwide number enrolled in the trial. It is expected that these numbers will be the same.

Justification: Baseline characteristics are based on patients who were randomised after successfully completing the screening period and received at least one of the trial medication.

Subject analysis set title	Part 1, Placebo BI 655064 (HV)
Subject analysis set type	Safety analysis
Subject analysis set description: Part 1, Healthy volunteers (HV): Placebo of BI 655064 injected subcutaneous on days 1, 8, 15, and 22 (once weekly) followed by a 6 weeks (120mg dosing group) or a 8 weeks (240mg dosing group) follow-up period. Within each dose group two subjects were to receive placebo.	

Primary: Part 1: Cmax after the first and last dose

End point title	Part 1: Cmax after the first and last dose ^[1]
End point description: Part 1: This outcome measure presents the maximum measured concentration of BI 655064 in plasma (Cmax) after the first and last (fourth) dose. More detailed time frame: Pharmacokinetic (PK) sample times: 0:30 hour (h) prior first administration of BI 655064 and 1 h, 8 h, 12 h, 24 h, 48 h, 72 h, 84 h, 96 h, 108 h, 120 h, 144 h, 167:30 h, 335:30 h, 503:30 h, 505 h, 516 h, 528 h, 552 h, 576 h, 600 h, 624 h, 648 h, 672 h, 696 h, 744 h, 816 h, 912 h, 1008 h, 1176 h, 1344 h, 1512 h, 1848 h thereafter; further administration times for BI 655064: 168 h, 336 h, and 504 h after first administration. All subjects were treated and provided data for at least 1 primary pharmacokinetic (PK) endpoint and	

therefore all subjects were also included in the PK set (PKS).

End point type	Primary
End point timeframe:	
after the first dose on day 1 and after the last dose on day 22	

Notes:

[1] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period. Justification: Only those arms for which the comparisons are presented in the clinical trial report thus, those that would yield meaningful results were reported.

Statistical analyses

Statistical analysis title	AUC 0-infinity after the last dose
Statistical analysis description:	
Dose proportionality for AUC 0-infinity was explored after the last administration of BI 65564 on Day 22.	
Comparison groups	Part 1, BI 655064 80mg (HV) v Part 1, BI 655064 120mg (HV) v Part 1, BI 655064 180mg (HV) v Part 1, BI 655064 240mg (HV)

Number of subjects included in analysis	32
Analysis specification	Pre-specified
Analysis type	other ^[13]
Parameter estimate	Slope
Point estimate	2.0091
Confidence interval	
level	95 %
sides	2-sided
lower limit	1.6607
upper limit	2.3575
Variability estimate	Standard error of the mean
Dispersion value	0.1706

Notes:

[13] - Dose proportionality was explored using a regression model. Based on the estimate for the slope parameter, a two sided 95% confidence interval for the slope was computed. Perfect dose proportionality would correspond to a slope of 1. PK endpoints on the log-transformed scale.

Primary: Part 1: AUCtau after the last dose

End point title	Part 1: AUCtau after the last dose ^[14]
End point description:	Area under the concentration-time curve of BI 655064 in plasma after the 4th dose over a uniform dosing interval t (AUC t,4) after the first and 4th dose. AUCtau is synonymus with AUC0-168.
End point type	Primary

End point timeframe:

PK sample times: 1, 12, 24, 48, 72, 96, 120, 144, 168, 192, 240, 312, 408, 504, 672, 840, 1008, 1344 h after the last administration of trial drug on day 22

Notes:

[14] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.

Justification: Only those arms for which the comparisons are presented in the clinical trial report thus, those that would yield meaningful results were reported.

Reporting groups

Reporting group title	Part 1, Placebo (HV)
-----------------------	----------------------

Reporting group description:

Part 1, Healthy volunteers (HV): Placebo of BI 655064 injected subcutaneous on days 1, 8, 15, and 22 (once weekly) followed by a 6 weeks (120mg dosing group) or a 8 weeks (240mg dosing group) follow-up period. Within each dose group two subjects were to receive placebo.

Reporting group title	Part 1, BI 655064 80mg (HV)
-----------------------	-----------------------------

Reporting group description:

Part 1, Healthy volunteers (HV): 80 mg of BI 655064 injected subcutaneous on days 1, 8, 15, and 22 (once weekly) followed by 6 weeks follow-up period.

Reporting group title	Part 1, BI 655064 120mg (HV)
-----------------------	------------------------------

Reporting group description:

Part 1, Healthy volunteers (HV): 120 mg of BI 655064 injected subcutaneous on days 1, 8, 15, and 22 (once weekly) followed by 6 weeks follow-up period.

Reporting group title	Part 1, BI 655064 180mg (HV)
-----------------------	------------------------------

Reporting group description:

Part 1, Healthy volunteers (HV): 180 mg of BI 655064 injected subcutaneous on days 1, 8, 15, and 22 (once weekly) followed by 6 weeks follow-up period.

Reporting group title	Part 1, BI 655064 240mg (HV)
-----------------------	------------------------------

Reporting group description:

Part 1, Healthy volunteers (HV): 240mg of BI 655064 injected subcutaneous on days 1, 8, 15, and 22 (once weekly) followed by 8 weeks follow-up period.

Reporting group title	Part 2, Placebo (RA)
-----------------------	----------------------

Reporting group description:

Part 2, patients with Rheumatoid arthritis (RA): Placebo matching BI 655064 120mg injected subcutaneous on days 1, 8, 15, 22, 29, 36, 43, 50, 57, 64, 71, and 78 (once weekly for 12 weeks) followed by 8 weeks follow-up period.

Reporting group title	Part 2, BI 655064 120mg (RA)
-----------------------	------------------------------

Reporting group description:

Part 2, patients with Rheumatoid arthritis (RA): 120 milligram (mg) of BI 655064 injected subcutaneous on days 1, 8, 15, 22, 29, 36, 43, 50, 57, 64, 71, and 78 (once weekly for 12 weeks) followed by 8 weeks follow-up period.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
06 March 2013	<p>In Amendment 1, at the request of the Spanish health authority, more specific wording was included in inclusion criterion 7 with regard to contraception for patients with Rheumatoid arthritis (RA). The stopping criteria for the trial were clarified at the request of the Paul Ehrlich Institute (PEI). Additional information was provided with respect to Quantiferon TB Gold testing and the laboratory assay for CD40 receptor occupancy. It was also specified that the tender joint count (TJC), swollen joint count (SJC), and disease activity score in 28 joints (DAS 28) scores would be calculated automatically in the eCRF in order to minimize the risk of investigator error. In addition, several typographical errors and inconsistencies in the CTP were corrected.</p> <p>In the original CTP, it was planned to treat an additional cohort of patients with RA at a dose of 180 mg BI 655064.</p>
10 June 2013	<p>In Amendment 2, this planned cohort was canceled due to concerns from the regulatory authority (PEI) and the trial team about projected too-high exposure to BI, and the total number of patients to be enrolled in the trial was adjusted as a result. The amendment also specified that the trial bioanalysts could have indirect unblinded access to PK, PD, and biomarker data. In addition, there were some changes in the collection of biomarker samples to facilitate evaluation of the effectiveness of BI 655064, clarification of PK and safety endpoints, and correction of additional typographical and language errors. The primary PK endpoints for Part 1 were also clarified in Amendment 2 (that is, that the primary endpoints were C_{max} and AUC_t after the first and last dose, and AUC_{0-∞} after the last dose).</p>
09 December 2013	<p>In Amendment 3, the inclusion and exclusion criteria for Part 2 of the trial were changed in order to allow a larger patient population to be tested, without interfering with the scientific validity of the trial. These alterations included allowing patients with RA who had previously had no response to anti-TNF medications to participate in the trial and adjustment of the trial analysis to include anti-TNF history in the model; the cut-off CRP value for inclusion was lowered from 1.0 to 0.8 mg/dL and the option to be included based on ESR values was also added; patients with a history of RA of longer than 5 years were also to be allowed to participate; and exclusion with regard to malignancies was updated to align with BI standards. The CTP was also amended to allow testing of the 240 mg dose of BI 655064 in healthy subjects. Some clarifications were also made in the trial flowchart and the assessment of AEs was updated to include drug-induced liver injury. The change in DAS28-CRP at Week 12 compared with baseline was also added as a secondary endpoint.</p>
07 May 2014	<p>In Amendment 4, the TCM responsibilities were reassigned. In addition, in order to increase the pool of potential participants, the dosing requirements for patients with MTX intolerance were adapted and it was specified that patients who had anti-rheumatoid factor positivity could be enrolled in the trial. DAS28-ESR EULAR response was added as a secondary endpoint. AE reporting was updated, an interim PK analysis was added in Part 2, and the randomization process was clarified.</p>
23 July 2014	<p>In Amendment 5, it was clarified that the trial was a Phase Ib (healthy subjects)/Phase IIa (patients with RA) study, and that the statistical testing would be applied to both parts of the trial. The joint assessment form was also updated.</p>

16 October 2014	In Amendment 6, an additional interim analysis was added to evaluate data for the primary endpoint from the first 36 patients who completed the Phase IIa part of the trial. DAS28-CRP AUC0-12week was added to the 'other efficacy endpoints'. IgG and IgM analyses were added to the safety laboratory tests. In addition, the statistical analyses were updated: a Bayesian efficacy analysis was added as the primary analysis of the primary endpoint and an exploratory analysis of steady state at Week 12 were added. It was specified that the informative prior for the Bayesian analysis was an expected response rate of 25% in the placebo group. The sample size computation was also adapted.
-----------------	--

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
