Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	30 June 2016
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	22 April 2016
Was the trial ended prematurely?	Yes

Notes:

General information about the trial

Main objective of the trial:

The primary objective of the PERSIST-1 study was to compare the efficacy of pacritinib with that of BAT in subjects with PMF, PPV-MF, or PET-MF. The primary efficacy measure for this analysis was the proportion of subjects achieving a $\geq 35\%$ reduction in spleen volume from baseline to Week 24, as measured by magnetic resonance imaging (MRI) or computed tomography (CT) scan

Protection of trial subjects:

This trial was conducted in compliance with International Conference on Harmonization (ICH) Good Clinical Practice (GCP) guidelines, US FDA regulations 21 Code of Federal Regulations Parts 50, 56, and 312, and with the laws and regulations of the country in which the research was conducted, whichever affords the greatest protection to the study subject.

No trial procedures were performed on trial participants until written consent had been obtained from them. The informed consent form (ICF), protocol, and amendments for this trial were submitted to and approved by the Ethics committee.

Routine monitoring was performed to verify that rights and well being of patients were protected. Also, any medication considered necessary for the patient's safety and well-being was given at the discretion of the Investigator.

Background therapy:

The most common concomitant medications by ATC class in the pacritinib and BAT arms, were Antipropulsives (49.1% and 48.1%, respectively), Proton Pump Inhibitors (33.6% and 50.9 %, respectively), Preparations Inhibiting Uric Acid Production (32.7% and 42.5%, respectively), Platelet Aggregation Inhibitors Excluding Heparin (32.7% and 37.7%, respectively), and Anilides (35.0% and 40.6%, respectively).

Evidence for comparator:

The control arm of the study consisted of best available therapies (BAT) , which was the same control arm used in the COMFORT-II phase 3 study of the currently approved JAK2 inhibitor, ruxolitinib. Due to the limitations in the approved indications for ruxolitinib and its regulatory and economic availability on a world-wide basis at the time this study was conducted, ruxolitinib was not included in the BAT treatment arm. Placebo control was deemed inappropriate for these subjects, given the likelihood of efficacy shown in early phase pacritinib clinical studies, as well as the proven efficacy of the approved ruxolitinib agent, which also inhibits the JAK2 pathway.

As with the completed phase 3 registrational ruxolitinib COMFORT studies, subjects were permitted to cross over from BAT to pacritinib. This was deemed essential to achieve appropriate equipoise for the participating subjects and to encourage participation given the lack of BAT agents approved for treatment of these MF patients. Crossover provided further scientific benefit as it enabled comparison of safety and efficacy with BAT treatment prior to crossover versus pacritinib treatment after crossover.

Actual start date of recruitment	08 January 2013
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Netherlands: 21
Country: Number of subjects enrolled	United Kingdom: 25

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	137
From 65 to 84 years	189
85 years and over	1

Subject disposition

Recruitment

Recruitment details:

327 patients from 12 countries (8 EU countries, US, Russia and Australia and New Zealand) were enrolled. Enrolment started on 08 January 2013. Last patient visit was on 22 April 2016.

Pre-assignment

Screening details:

Participants had a washout period (day -35 to day -7) and screening evaluations between day -14 to day -5 before entering treatment.

Period 1

Period 1 title	overall period
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

Blinding implementation details:

Investigators, site personnel, subjects, clinical monitors, and a designated field CRA were unblinded to individual study treatment assignment. Except certain CTI personnel responsible for pharmacovigilance activities, regulatory submissions, supply chain, and GCP compliance, the sponsor and independent radiographic assessors were blinded throughout the entire study. The sponsor remained blinded to individual study treatment assignment until the database lock for primary analysis.

Arms

Are arms mutually exclusive?	Yes
Arm title	Pacritinib

Arm description:

Subjects who received pacritinib were to self-administer four 100 mg capsules per day orally, once a day (400 mg daily), at the same time of day, with or without food.

Arm type	Experimental
Investigational medicinal product name	Pacritinib
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Capsule
Routes of administration	Oral use

Dosage and administration details:

Subjects who received pacritinib were to self-administer four 100 mg capsules per day orally, once a day (400 mg daily), at the same time of day, with or without food.

Arm title	Best available Therapies (BAT)
------------------	--------------------------------

Arm description:

Best available Therapies (BAT): Subjects receiving BAT were treated on a schedule commensurate with the therapy(ies) chosen by the investigator. BAT agents could be administered as monotherapy or in combinations, and could be changed (eg, new dose, new schedule, new regimen) as clinically indicated without limitation. Best available therapies may have included any physician-selected treatment for PMF, PPV-MF, or PET-MF, with the exclusion of JAK inhibitors, and may have included any treatment received before study entry. Best available therapies also could have included no treatment (watch and wait) or symptom-directed treatment without MF-specific treatment. BAT therapies could not be co-administered to subjects in the pacritinib arm for treatment of MF.

Arm type	Active comparator
----------	-------------------

Investigational medicinal product name	Hydroxyurea, prednisone, interferon-alpha, thalidomide, danazole, prednisolone, busulfan
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Capsule, Solution for injection, Tablet
Routes of administration	Intravenous use, Oral use

Dosage and administration details:

BAT agents could be administered as monotherapy or in combinations, and could be changed (eg, new dose, new schedule, new regimen) as clinically indicated without limitation. The pharmaceutical forms and routes of administration depend on the specific product and its clinical indication. Examples of the most used products, their pharmaceutical form and route of administration are shown above.

BAT therapies could not be co-administered to subjects in the pacritinib arm for treatment of MF.	

Primary: $\geq 35\%$ Spleen Volume Reduction

End point title	$\geq 35\%$ Spleen Volume Reduction
End point description:	
The primary efficacy endpoint was the proportion of subjects achieving a $\geq 35\%$ spleen volume reduction (SVR) from baseline to Week 24, as measured by MRI or CT scan. For each subject, the same imaging modality was to have been used throughout the study. Splenic progression was followed for subjects who discontinued treatment but did not progress. Subjects with progressive disease documented prior to week 24 who opted to continue on study treatment did not undergo week 24 imaging if the date of progression was at week 20 or later. For subjects who crossed over after week 24, an MRI was done within 30 days prior to the start of pacritinib treatment.	
End point type	Primary
End point timeframe:	
MRI or CT scan (without contrast agents) was performed prior to randomization (days -10 to -4). MRI or CT scan was performed at the end of week 12 \pm 7 days and every 12 weeks thereafter, and at treatment termination.

level	95 %
sides	2-sided
lower limit	14.1
upper limit	24.9

Secondary: > 50% TSS reduction on MPN-SAF TSS 2.0

End point title	> 50% TSS reduction on MPN-SAF TSS 2.0
-----------------	--

End point description:

The secondary endpoint in the study was the proportion of subjects with a $\geq 50\%$ reduction from baseline to Week 24 in the subject reported outcome instrument, MPN-SAF TSS 2.0. The original version of this instrument (MPN-SAF TSS) was administered to the first 179 subjects enrolled in the study. However, after discussion with FDA, agreement was reached on modified questions to be included in the instrument. The new version (termed MPN-SAF TSS 2.0) was administered to all subsequently enrolled subjects throughout their participation in the study.

A total of 148 subjects (100 pacritinib, 48 BAT) were tested with the MPN-SAF TSS 2.0 and comprise the ITT population for this endpoint. Responses (on a scale from 0 [absent] to 10 [worst imaginable]) to questions about the symptoms of tiredness, early satiety, abdominal discomfort, night sweats, pruritus, bone pain, and pain under the ribs on the left side were used to compute the MPN-SAF TSS 2.0 results.

End point type	Secondary
----------------	-----------

End point timeframe:

Daily after receiving eDiary and throughout treatment. Subject-reported symptoms on MPN-SAF TSS 2.0: daily for 7 to 10 consecutive days prior to start of study treatment + daily from day 1 through week 48 or until subject discontinuation.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
24 September 2012	Amendment 1 included the following changes: <ul style="list-style-type: none">- addition of a new inclusion criterion- addition of dose management guidelines for QTc interval prolongation- clarification to dose reduction for pacritinib-related, nonhematologic toxicities- change of timepoints for spleen size assessments.
16 March 2013	Amendment 2 included the following changes: <ul style="list-style-type: none">- revision of secondary and exploratory objectives- addition of a crossover section from BAT to pacritinib including criteria- revision of inclusion and exclusion criteria- addition of a section for withdrawal from study procedures- revision of the method of treatment assignment- addition of explanation of QTc calculation and recalculation- addition of provision of prescription for loperamide (and instructions for use)- AE section was expanded- amendment of spleen volume measurement by MRI or CT- a modified ITT population was added- the PP population definition was revised- the Data Monitoring Committee was changed to an IDMC- major changes to study assessments.
15 August 2013	Amendment 3 included the following changes: <ul style="list-style-type: none">- revision of inclusion and exclusion criteria- update of statistical methods section- revision of study design- revision of period of blinding for independent radiographic assessors- replacement of MPN-SAF TSS with MPN-SAF TSS 2.0 for subjects randomized under protocol Amendment 3- revision of the endpoint for collection of AEs and SAEs to the last day of study participation- amendments and changes to the ITT population- Major changes to the study assessments.
30 January 2014	Amendment 4 included the following changes: <ul style="list-style-type: none">- revision of sample size of randomized subjects- revision of statistical methods section- clarification of PK and PD assessments- clarification and correction of inconsistencies regarding the timing of the administration of the PGIA, MPN-SAF TSS (all versions), pain medication log, and QoL assessments; clarification regarding use of the MPN-SAF TSS (all versions)- amendment of timepoints prior to start of study treatment- revision of the SAE collection time period.
21 February 2014	Amendment 4a: <ul style="list-style-type: none">- revision of sample size of randomized subjects.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? Yes

Date	Interruption	Restart date
------	--------------	--------------

08 February 2016	PERSIST-1 was placed on Partial Clinical Hold by FDA on 2016 FEB 04 and then on Full Clinical Hold 2016 FEB 08. At the time of the FDA Partial Clinical Hold, no PERSIST-1 subjects were permitted to start pacritinib as initial or crossover treatment, and subjects not deriving benefit after 30 weeks of pacritinib treatment were to stop pacritinib. When the FDA Full Clinical Hold was imposed, all PERSIST-1 subjects discontinued pacritinib study treatment and no subjects were allowed to start pacritinib as initial or crossover treatment. Subjects continued to be followed for OS.	-
