

Clinical trial results:

A prospective, randomized, open-label, two-arm Phase III study to evaluate treatment-free remission (TFR) rate in patients with Philadelphia chromosome-positive CML after two different durations of consolidation treatment with nilotinib 300 mg BID

Analysis stage	Final
Date of interim/final analysis	08 July 2020
Is this the analysis of the primary completion data?	No

Global end of trial reached?	Yes
Global end of trial date	08 July 2020
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary objective of the study is to assess the optimal duration of consolidation treatment with nilotinib 300 mg twice daily (BID) in order that patients remained in treatment free remission (TFR) (\geq MR4.0) without molecular relapse 12 months after entering the TFR phase.

Protection of trial subjects:

The study was in compliance with the ethical principles derived from the Declaration of Helsinki and the International Conference on Harmonization (ICH) Good Clinical Practice (GCP) guidelines. All the local regulatory requirements pertinent to safety of trial subjects were also followed during the conduct of the trial.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	15 April 2013
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	512
From 65 to 84 years	108
85 years and over	0

Subject disposition

Recruitment

Recruitment details: -

Pre-assignment

Screening details:

For one participant randomized to Nilotinib 36-month treatment arm, the informed consent was not obtained prior to any study specific procedure. This participant discontinued the study before entering the TFR phase.

Period 1

Period 1 title	Treatment phase
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	Nilotinib 24-month treatment

Arm description:

Participants were treated with nilotinib 300mg BID for 24 months and, thereafter, entered the 36-month TFR phase

Arm type	Experimental
Investigational medicinal product name	Nilotinib
Investigational medicinal product code	AMN107
Other name	
Pharmaceutical forms	Capsule, hard
Routes of administration	Oral use

Dosage and administration details:

Nilotinib daily oral dose of 300 mg BID, supplied as 150 mg hard gelatin capsules.

Arm title	Nilotinib 36-month treatment
------------------	------------------------------

Arm description:

Participants were treated with nilotinib 300mg BID for 36 months and, thereafter, entered the 24-month TFR phase

Arm type	Experimental
Investigational medicinal product name	Nilotinib
Investigational medicinal product code	AMN107
Other name	
Pharmaceutical forms	Capsule, hard
Routes of administration	Oral use

Dosage and administration details:

Nilotinib daily oral dose of 300 mg BID, supplied as 150 mg hard gelatin capsules.

Arm title	Not randomized
------------------	----------------

Arm description:

Participants were treated with nilotinib 300mg BID for 24 months, but did not achieve a sustained molecular response after 24 months of treatment and were not randomized.

Arm type	Experimental
----------	--------------

Investigational medicinal product name	Nilotinib
Investigational medicinal product code	AMN107
Other name	
Pharmaceutical forms	Capsule, hard
Routes of administration	Oral use

Dosage and administration details:

Nilotinib daily oral dose of 300 mg BID, supplied as 150 mg hard gelatin capsules.

Primary: Percentage of participants who remained in treatment free remission (TFR) without molecular relapse 12 months after entering the TFR phase

End point title	Percentage of participants who remained in treatment free remission (TFR) without molecular relapse 12 months after entering the TFR phase
End point description: Number of participants who remained in TFR (\geq molecular response (MR) 4.0) without molecular relapse 12 months after entering the TFR phase (without re-starting nilotinib therapy) divided by the number of participants who entered the TFR phase and multiplied by 100. Molecular relapse during TFR is defined as the loss of major molecular response (MMR), or the confirmed loss of MR4.0 (defined by 3 consecutive tests less than MR4.0 assessed at 3 consecutive visits during TFR phase). Participants dropping out early from the study during the TFR phase were considered as unsuccessful TFR. Confidence intervals were calculated based on the Exact Clopper-Pearson method. MMR is defined as ≥ 3.0 log reduction in BCR-ABL transcripts compared to the standardized baseline or $\leq 0.1\%$ BCR-ABL. MR4.0 is defined as either detectable disease $\leq 0.01\%$ BCR-ABL or undetectable disease in cDNA with $\geq 10,000$ ABL transcripts	
End point type	Primary
End point timeframe: 12 months after entering the TFR phase, which is after 36 months from study treatment start for Nilotinib 24-month treatment arm and after 48 months from study treatment start for Nilotinib 36-month treatment arm

Statistical analyses

No statistical analyses for this end point

Secondary: Cumulative incidence of MMR during the post-randomization consolidation phase

End point title	Cumulative incidence of MMR during the post-randomization consolidation phase ^[4]
-----------------	--

End point description:

Number of participants who were in MMR during the post-randomization consolidation phase divided by the number of enrolled participants and multiplied by 100. Post-randomization consolidation phase corresponded to the 12-month additional treatment (after randomization) for Nilotinib 36-month treatment arm.

Confidence intervals were calculated based on the Exact Clopper-Pearson method.

MMR is defined as ≥ 3.0 log reduction in BCR-ABL transcripts compared to the standardized baseline or $\leq 0.1\%$ BCR-ABL.

End point type	Secondary
----------------	-----------

End point timeframe:

From randomization (month 24 after study treatment start) up to 36 months after study treatment start

Notes:

[4] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.

Justification: Only participants randomized to Nilotinib 36-month treatment arm entered the post-randomization consolidation phase.

End point values	Nilotinib 36-month treatment

Statistical analyses

No statistical analyses for this end point

Secondary: Progression-free survival (PFS) during the TFR phase of the study.

End point title	Progression-free survival (PFS) during the TFR phase of the study.
-----------------	--

End point description:

PFS is defined as the time from the date of start of the nilotinib TFR phase to the date of accelerated phase/blast crisis (AP/BC) or death, whichever came first. Participants randomized in Nilotinib 36-month treatment arm had a maximum of 24 months of TFR phase, whereas participants randomized in Nilotinib 24-month treatment arm had a maximum of 36 months of TFR phase.

Patients not known to have recurred or died on or before the cut-off date for PFS analysis were censored at the date of their last assessment (cytogenetic, hematology or extramedullary) for patients who were on study, and at the date of last contact for patients who were in follow-up.

Note: 999 indicates value is not applicable.

End point type	Secondary
----------------	-----------

End point timeframe:

From the start of the TFR phase to progression to AP/BC or death up to 24 months after entering TFR phase for Nilotinib 36-month treatment arm and up to 36 months after entering TFR phase for Nilotinib 24-month treatment arm

End point values	Nilotinib 24-month treatment	Nilotinib 36-month treatment

Number of subjects analysed	119	104		
Units: Months				
median (confidence interval 95%)	999 (999 to 999)	999 (999 to 999)		

Statistical analyses

No statistical analyses for this end point

Secondary: Treatment -free survival (TFS) during the TFR phase of the study

End point title	Treatment -free survival (TFS) during the TFR phase of the study
-----------------	--

End point description:

TFS is defined as the time from the start of the TFR phase to the date of the earliest of the following: loss of MMR, confirmed loss of MR4.0, re-start of nilotinib treatment, progression to AP/BC, or death from any cause. Patients not known to have had any of the events on or before the cut-off date were censored at the earlier of the date of their last assessment for patients who were still on study and the date of last contact for patients who were in follow-up. Participants randomized in Nilotinib 36-month treatment arm had a maximum of 24 months of TFR phase, whereas participants randomized in Nilotinib 24-month treatment arm had a maximum of 36 months of TFR phase.

MMR is defined as ≥ 3.0 log reduction in BCR-ABL transcripts compared to the standardized baseline or $\leq 0.1\%$ BCR-ABL.

MR4.0 is defined as either detectable disease $\leq 0.01\%$ BCR-ABL IS or undetectable disease in cDNA with $\geq 10,000$ ABL transcripts (numbers of ABL transcripts in the same volume of cDNA used to test for BCR-ABL)

End point type	Secondary
----------------	-----------

End point timeframe:

From the start of the TFR phase to the date of occurrence of treatment-free survival event, up to 24 months after entering TFR phase for Nilotinib 36-month treatment arm and up to 36 months after

End point values	Nilotinib 24-month treatment	Nilotinib 36-month treatment		
Subject group type	Reporting group	Reporting group		
Number of subjects analysed	119	104		
Units: Months				
median (confidence interval 95%)	4.1 (3.7 to 5.5)	4.2 (3.7 to 19.7)

Secondary: Overall survival (OS) rate during the TFR phase of the study.

End point title	Overall survival (OS) rate during the TFR phase of the study. ^[7]
-----------------	--

End point description:

OS is defined as the time from start of the TFR phase to the time of death due to any cause. Participants randomized in Nilotinib 36-month treatment arm had a maximum of 24 months of TFR phase, whereas participants randomized in Nilotinib 24-month treatment arm had a maximum of 36 months of TFR phase.

For participants without any event on or before the cut-off date, survival time will be censored at the date of their last assessment for patients who are still on study, and at the date of last contact for patients who are in follow-up.

Note: 999 indicates value is not applicable.

End point type	Secondary
----------------	-----------

End point timeframe:

From the start of the TFR phase to death due to any cause, assessed up to 24 months after entering TFR phase for Nilotinib 36-month treatment arm and up to 36 months after entering TFR phase for Nilotinib 24-month treatment arm

Notes:

[7] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.

Justification: This endpoint refers to TFR phase not the baseline period

Adverse events

Adverse events information

Timeframe for reporting adverse events:

AEs were collected during:

- Induction/consolidation phase, up to 24 months (or 36 months for Nilotinib 36-month treatment arm)
- Re-treatment phase, up to 36 months for Nilotinib 24-month treatment arm (or 24 months for Nilotinib 36-month treatment arm)

Adverse event reporting additional description:

Consistent with EudraCT disclosure specifications, Novartis has reported under the Serious adverse events field "number of deaths resulting from adverse events" all those deaths, resulting from serious adverse events that are deemed to be causally related to treatment by the investigator

Assessment type	Systematic

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
01 April 2014	The main purpose for this substantial amendment was the inclusion of the optional Stem cells ENESTpath substudy "Leukemic stem cells quantification in patients with chronic myeloid leukemia included in the ENESTpath trial"; the purpose of this substudy was to evaluate the importance of leukemic stem cells (LSC) in the long-term maintenance of the disease and their role in the relapse of patients during the TFR phase.
10 February 2015	The main purposes for this substantial amendment were: 1. To modify the study sample size based on new data from the ENESTcmr and STIM studies and a number of published clinical trials 2. To amend the secondary objectives of the study and related endpoints 3. To incorporate the safety recommendations provided by the DMC on patients with severe cardiovascular ischemic events experienced before entering the study or while on study
23 September 2015	To update the protocol including the 'CML patient's voice' Italian substudy to evaluate the emotional aspects in patients participating to a nilotinib Treatment-free remission (TFR) trial. This substudy aims to examine patients' psycho-emotional characteristics, quality of life and experiences of being involved in CAMN107AIC05 trial and its discontinuation using a qualitative-quantitative mixed method. The 'CML patient's voice' Italian substudy will be conducted in Italy only.
01 June 2016	To include hepatitis B virus testing as one of the study procedures, to identify study patients who may be at risk of hepatitis B reactivation. Reactivation of hepatitis B virus can occur in patients who are chronic carriers of this virus and are receiving a drug of the BCR-ABL TKI class such as nilotinib. Some cases involving BCR-ABL TKI resulted in acute hepatic failure or fulminant hepatitis leading to liver transplantation or a fatal outcome.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

Due to EudraCT system limitations, which EMA is aware of, data using 999 as data points in this record are not an accurate representation of the clinical trial results. Please use <https://www.novctrd.com/> for complete trial results.

Notes:
