Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	25 November 2021
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	18 August 2020
Was the trial ended prematurely?	Yes

Notes:

General information about the trial

Main objective of the trial:

The principal objective of the trial is to determine whether there is a difference in the overall survival (OS) of patients with high risk AML/MDS after a FLAMSA-BU transplant compared with patients receiving one of the three currently used transplant regimens (FMA/FBA/FB-ATG).

Protection of trial subjects:

Busulphan at the recommended dose and schedule is associated with profound myelosuppression. Severe granulocytopenia, thrombocytopenia, anaemia, or any combination thereof may develop. Frequent complete blood counts, including differential white blood cell counts, and platelet counts will be monitored during the treatment and until recovery is achieved. During periods of myelosuppression, prophylactic or empiric use of anti-infectives (bacterial, fungal, viral) will be adopted for the prevention and management of infections during the neutropenic period. Platelet and red blood cell support, as well as the use of growth factors such as granulocyte colony stimulating factor (G-CSF), will be employed as medically indicated. Busulphan has not been studied in patients with hepatic impairment. Since busulphan is mainly metabolised through the liver we will continue to monitor serum transaminase, alkaline phosphatase, and bilirubin regularly for 28 days following transplant for early detection of hepatotoxicity. Only patients with adequate hepatic function will be enrolled into the trial. Hepatic veno-occlusive disease is a major complication that can occur during treatment with busulphan. Patients who have received prior radiation therapy, greater than or equal to three cycles of chemotherapy, or prior stem cell transplant may be at an increased risk. We will therefore monitor such patients closely. No patients treated in clinical trials have yet experienced cardiac tamponade or other specific cardiac toxicities related to busulphan. However cardiac function will be monitored closely in the immediate transplant period. Occurrence of acute respiratory distress syndrome with subsequent respiratory failure associated with interstitial pulmonary fibrosis has been reported in busulphan studies in one patient who died, although, no clear aetiology was identified. In addition, busulphan might induce pulmonary toxicity that may be additive to the effects produced by other agents.

Background therapy: -

Evidence for comparator:

Transplant regimens selected for high risk AML and MDS patients vary across transplant centres in the UK and there is no clear consensus concerning the optimum transplant regimen. The control arm for this trial has been designed to include the three most commonly used RIC regimens currently used in the UK in this patient population.

Fludarabine/Melphalan/Alemtuzumab (FMA):

The Fludarabine/Melphalan/Alemtuzumab (FMA) RIC regimen has been used extensively in the UK for the treatment of patients with AML and MDS in whom a standard myeloablative transplant is contraindicated. The use of melphalan in conditioning for allogeneic SCT is based on its antitumour activity in a number of haematological malignancies in addition to its immunosuppressive effects^{24,25}. Furthermore, fludarabine is a potent immunosuppressive agent that has potential synergistic activity with alkylators²⁶. T cell depletion using alemtuzumab has been used in combination with fludarabine and melphalan to reduce the incidence of severe GvHD¹⁰. Studies have shown 3 year OS rates and DFS rates of 41% and 37% respectively using this transplant regimen⁸. However, in patients with relapsed/refractory AML at the time of transplant, the 3 year DFS is substantially reduced to 20%¹¹. Separate studies have also indicated a poorer transplant outcome in patients with high risk disease.

Fludarabine/Busulphan/Alemtuzumab (FBA):

The combination of busulphan with fludarabine as conditioning therapy has been associated with significant clinical activity with OS rates of 30% at 2 years have been reported in patients with high risk AML or MDS²⁷.

A retrospective analysis comparing fludarabine/busulphan versus fludarabine/melphalan based transplant conditioning revealed that the melphalan group was associated with a higher rate of non-relapse mortality and had a more intense myelosuppressive effect. However, survival rates in the busulphan group were not improved due to the higher rates of disease relapse s

Actual start date of recruitment	01 June 2013
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	United Kingdom: 244
Worldwide total number of subjects	244
EEA total number of subjects	0

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	183
From 65 to 84 years	61
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

244 patients with AML or MDS who were clinically indicated to receive a RIC allograft were recruited between Sept 2013 to Feb 2017 (164 AML, 80 MDS)

Pre-assignment

Screening details:

Screening commenced following consent and prior to patient randomisation in order to confirm eligibility.

Screening assessments included: medical history, height, weight, demographic data, blood tests, clinical and cardiac assessments, ECOG performance, pregnancy test and bone marrow samples for research.

Period 1

Period 1 title	Overall Trial (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	Control

Arm description:

Sites could choose which control arm they wanted to use either;

Fludarabine/Melphalan/Alemtuzumab (FMA)

Fludarabine/busulphan/alemtuzumab (FBA)

Fludarabine/busulphan/ATG (FB-ATG)

Arm type	Active comparator
Investigational medicinal product name	Fludarabine
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Powder for concentrate for solution for injection/infusion
Routes of administration	Intravenous use

Dosage and administration details:

30mg/m² once a day IV for 5 days

Investigational medicinal product name	Melphalan
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Powder and solvent for solution for injection/infusion
Routes of administration	Intravenous use

Dosage and administration details:

140mg/m² once a day for one day

Investigational medicinal product name	Busulphan
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Concentrate for solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

3.2mg.kg once daily for 2 days

Statistical analyses

Statistical analysis title	Overall Survival
Statistical analysis description: Therefore assuming a 2 year OS in the control arm (FMA/FBA) of 25%, in order to detect a 15% improvement in the experimental arm (FLAMSA-BU), a total of about 214 patients (2 sided $\alpha=0.15$, $\beta=0.16$) were required. In order to account for the 10% of patients in the trial who are randomised but do not undergo transplant, the trial aimed to recruit around 240 patients on a 1:1 basis.

Adverse events

Adverse events information

Timeframe for reporting adverse events:

All AEs were to be documented and reported from the date of commencement of protocol defined treatment until 30 days after the date of transplant

Adverse event reporting additional description:

The collection and reporting of AEs were in accordance with the Medicines for Human Use Clinical Trials Regulations 2004 and its subsequent amendments. The Investigator should assess the seriousness and causality (relatedness) of all AEs experienced by the patient with reference to the Investigator Brochure.

Non-serious adverse events	Control	Experimental	
Total subjects affected by non-serious adverse events			
subjects affected / exposed	66 / 122 (54.10%)	89 / 122 (72.95%)	
Investigations			
Lymphocyte count decreased			
subjects affected / exposed	14 / 122 (11.48%)	16 / 122 (13.11%)	
occurrences (all)	30	40	
Neutrophil count decreased			
subjects affected / exposed	35 / 122 (28.69%)	37 / 122 (30.33%)	
occurrences (all)	78	56	
Platelet count decreased			
subjects affected / exposed	31 / 122 (25.41%)	38 / 122 (31.15%)	
occurrences (all)	77	158	
White blood cell count decreased			
subjects affected / exposed	25 / 122 (20.49%)	30 / 122 (24.59%)	
occurrences (all)	54	48	
Blood and lymphatic system disorders			
Anaemia			
subjects affected / exposed	21 / 122 (17.21%)	32 / 122 (26.23%)	
occurrences (all)	29	73	

Febrile neutropenia subjects affected / exposed occurrences (all)	24 / 122 (19.67%) 27	46 / 122 (37.70%) 52	
Gastrointestinal disorders			
Diarrhoea subjects affected / exposed occurrences (all)	11 / 122 (9.02%) 11	17 / 122 (13.93%) 18	
mucositis oral subjects affected / exposed occurrences (all)	10 / 122 (8.20%) 10	16 / 122 (13.11%) 16	
Nausea subjects affected / exposed occurrences (all)	6 / 122 (4.92%) 9	11 / 122 (9.02%) 11	
Infections and infestations			
Device related infection subjects affected / exposed occurrences (all)	3 / 122 (2.46%) 3	10 / 122 (8.20%) 10	
Other, specify subjects affected / exposed occurrences (all)	7 / 122 (5.74%) 10	8 / 122 (6.56%) 11	
Sepsis subjects affected / exposed occurrences (all)	1 / 122 (0.82%) 1	12 / 122 (9.84%) 12	
Metabolism and nutrition disorders			
Anorexia nervosa subjects affected / exposed occurrences (all)	3 / 122 (2.46%) 3	11 / 122 (9.02%) 11	

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
12 August 2013	Addition of FB-ATG regimen Patients should be randomised 2-6 weeks prior to transplant admission date Changes in scheduling solely for logistical reasons or to allow weekday administration of chemotherapy permitted without approval from CI or CC
11 April 2014	Addition of new inclusion criteria; Patients with Flt-3 ITD positive AML; Patients with persistent or rising MRD levels, who have a morphological CR; Patients who have been defined as high risk by MRD criteria Reclassification of T-cell depletion agents from IMPS to NIMPs
15 December 2014	Modification to guidance on Mycophenolate Mofetil Patients 60 years and over omit day -7 busulphan and count as a rest day Clarification of patients age range for the FLAMSA-Bu schedule
20 January 2015	Revised schedule for FLAMSA-BU conditioning regimen in patients 60 years and over. Exclusion criteria reworded to clarify the inclusion of patients who have had a previous malignancy and which also applies to those with a Sorror score of greater than 3 due to a previous malignancy
27 May 2015	Patients with Hep-B are now allowed to be included as the presence of the virus does not cause any issues with treatment. There is new wording in the patient information sheet to clarify the aim of the clinical trial and also to state that there may be some variation in the number of days for treatment depending on the local hospital schedules.
14 December 2015	to allow the inclusion of patients defined as patients not in complete remission (CR) after the first course of induction therapy and patients with secondary AML who have a previous history of myelodysplasia, antecedent haematological disease or chemotherapy exposure in CR1 or CR2. The classification of high risk patients defined according to the clinical trial AML 17 has been removed as the AML 17 trial is now closed. The stopping rule has been redefined on advice from the trial steering committee for the trial. This was based on the data obtained from the trial so far.
16 February 2018	Addition of Clatterbridge as a site
25 March 2019	Change of PI at Leicester Royal Infirmary from Dr Ann Hunter to Dr Alexander Martin

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

None reported
