

Clinical trial results:

Efficacy and safety of tianeptine oral administration (25 to 50 mg/day) in elderly patients suffering from Major Depressive Disorder.

A 8-week, randomized, double-blind, flexible-dose, parallel groups, placebo-controlled, international, multicentre study with escitalopram as active control, followed by an optional double-blind extension treatment period of 16 weeks.

Summary

EudraCT number	2012-005612-26
Trial protocol	SK FI EE BG
Global end of trial date	13 January 2016

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	13 January 2016
Is this the analysis of the primary completion data?	Yes
Primary completion date	13 January 2016
Global end of trial reached?	Yes
Global end of trial date	13 January 2016
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

To demonstrate the antidepressant efficacy of an 8-week tianeptine oral administration in elderly out-patients suffering from Major Depressive Disorder compared to placebo. The assay sensitivity will be evaluated comparing escitalopram to placebo.

Protection of trial subjects:

This study was conducted in accordance with Good Clinical Practice standards, ethical principles stated in the Declaration of Helsinki and applicable regulatory requirements. After the subject has ended his/her participation in the trial, the investigator provided appropriate medication and/or arranged access to appropriate care for the patient.

Background therapy:

-

Evidence for comparator:

-

Actual start date of recruitment	28 October 2013
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Worldwide total number of subjects	311
EEA total number of subjects	242

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	0
From 65 to 84 years	310
85 years and over	1

Subject disposition

Recruitment

Recruitment details:

Investigators were General Practitioners, specialists in psychiatry.

Pre-assignment

Screening details:

Male or female out-patients, ≥ 65 -year old, fulfilling DSM-IV-TR criteria for a moderate to severe episode of a recurrent major depressive disorder, with Hamilton depression rating scale 17 items (HAM-D) total score ≥ 22 and clinical global impression (CGI) severity of illness score ≥ 4 .

Period 1

Period 1 title	Double-blind treatment period of 8 weeks
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator

Arms

Are arms mutually exclusive?	Yes
Arm title	Tianeptine

Arm description:

All patients received 25 mg/day of tianeptine during the first 2 weeks of treatment. At W2, patients with insufficient clinical improvement according to a blind pre-determined clinical improvement criterion received 50 mg/day. After W2, the 25 mg or 50 mg dose was maintained up to W8.

Arm type	Experimental
Investigational medicinal product name	Tianeptine
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Capsule
Routes of administration	Oral use

Dosage and administration details:

Capsules of 12.5 or 25 mg of tianeptine, taken orally twice daily (one capsule in the morning and one capsule in the evening before meals).

For patients receiving tianeptine 25 mg daily at inclusion (W0), a potential adjustment to 50 mg daily might occur at Week-2 (W2) using pre-determined fixed criterion, in double-blind conditions (neither the investigator, neither the sponsor staff, nor the patients knew whether the dose had been increased) in case of insufficient improvement of depressive symptoms. Patients with sufficient improvement remained on tianeptine 25 mg daily. During tapering period, dose of tianeptine was unchanged.

Arm title	Escitalopram
------------------	--------------

Arm description:

All patients received a starting dosage of 5 mg/day during the first 2 weeks of treatment. At W2, all patients increased to 10 mg/day (mandatory adjustment). At the end of the study or in case of premature study withdrawal after W2, all patients received 5 mg/day for the last week (tapering period).

Arm type	Active control to assay sensitivity
Investigational medicinal product name	Escitalopram
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Capsule
Routes of administration	Oral use

Dosage and administration details:

Capsule of 5 mg or 10 mg of escitalopram or placebo, taken orally twice daily (one escitalopram capsule in the morning and one placebo capsule in the evening before meals). Patients received 5 mg daily from W0 to W2, then 10 mg daily from W2. A one-week tapering period at 5 mg/day was planned to avoid

possible withdrawal reactions.

Arm title	Placebo
Arm description: Potential or mandatory dose increase (tianeptine and escitalopram groups, respectively) and dose decrease (escitalopram group) were in blind condition.	
Arm type	Placebo
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Capsule
Routes of administration	Oral use

Dosage and administration details:

One capsule taken orally twice daily (one capsule in the morning and one capsule in the evening before meals).

Number of subjects in period 1	Tianeptine	Escitalopram	Placebo
Started	105	99	107
Completed	97	88	91
Not completed	8	11	16
Adverse event, non-fatal	3	6	6
Non medical reasons	3	2	5
Lack of efficacy	2	2	5
Protocol deviation	-	1	-

Period 2

Period 2 title	Optional extension period of 16 weeks
Is this the baseline period?	No
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator

Arms

Are arms mutually exclusive?	Yes
------------------------------	-----

Arm title	Tianeptine
Arm description:	
To continue in the optional extension period, patients had to be responder to treatment according to HAM-D total score at W8 (decrease from baseline in HAM-D total score of at least 50%). At W12, only patients with a Clinical Global Impression (CGI) global improvement (item 2) ≤ 2 could continue in the optional extension period up to W24.	
Arm type	Experimental
Investigational medicinal product name	Tianeptine
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Capsule
Routes of administration	Oral use
Dosage and administration details:	
Capsules of 12.5 or 25 mg of tianeptine, taken orally twice daily (one capsule in the morning and one capsule in the evening before meals). The tianeptine dose fixed in blind condition at W2 according to clinical improvement (25 mg/day or 50 mg/day) remained unchanged during the optional extension period. The dose of tianeptine was unchanged during the tapering period (end of the study or in case of premature study discontinuation).	
Arm title	Escitalopram

Arm description:	
To continue in the optional extension period, patients had to be responder to treatment according to HAM-D total score at W8 (decrease from baseline in HAM-D total score of at least 50%). At W12, only patients with a Clinical Global Impression (CGI) global improvement (item 2) ≤ 2 could continue in the optional extension period up to W24.	
Arm type	Active control to assay sensitivity
Investigational medicinal product name	Escitalopram
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Capsule
Routes of administration	Oral use
Dosage and administration details:	
Capsule of 5 mg or 10 mg of escitalopram or placebo, taken orally twice daily (one escitalopram capsule in the morning and one placebo capsule in the evening before meals). During the optional extension period, the patients received 10 mg/day. A one-week tapering period at 5 mg/day was planned to avoid possible withdrawal reactions at the end of the study or in case of premature study discontinuation.	
Arm title	Placebo

Arm description:	
To continue in the optional extension period, patients had to be responder to treatment according to HAM-D total score at W8 (decrease from baseline in HAM-D total score of at least 50%). At W12, only patients with a Clinical Global Impression (CGI) global improvement (item 2) ≤ 2 could continue in the optional extension period up to W24.	
Arm type	Placebo
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Capsule
Routes of administration	Oral use
Dosage and administration details:	
One capsule taken orally twice daily (one capsule in the morning and one capsule in the evening before meals).	

Number of subjects in period 2 ^[1]	Tianeptine	Escitalopram	Placebo
Started	77	75	57
Completed	71	69	48
Not completed	6	6	9
Adverse event, non-fatal	1	2	2
Lack of efficacy	4	1	5
Protocol deviation	1	-	-
Non medical reasons	-	3	2

Notes:

[1] - The number of subjects starting the period is not consistent with the number completing the preceding period. It is expected the number of subjects starting the subsequent period will be the same as the number completing the preceding period.

Justification: To continue in the optional extension period, patients had to be responder to treatment according to HAM-D total score at W8 (decrease from baseline in HAM-D total score of at least 50%). At W12, only patients with a Clinical Global Impression (CGI) global improvement (item 2) ≤ 2 could continue in the optional extension period up to W24. 20 patients in the tianeptine group, 13 patients in the escitalopram group and 34 patients in the placebo group did not enter the optional extension period.

Period 3

Period 3 title	Tapering period of 1 week
Is this the baseline period?	No
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator

Arms

Are arms mutually exclusive?	Yes
Arm title	Tianeptine

Arm description:

During tapering period, dose of tianeptine was unchanged. The tapering period was planned after W2 to avoid discontinuation symptoms of escitalopram as recommended in the SmPC of escitalopram.

Arm type	Experimental
Investigational medicinal product name	Tianeptine
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Capsule
Routes of administration	Oral use

Dosage and administration details:

Capsules of 12.5 or 25 mg of tianeptine, taken orally twice daily (one capsule in the morning and one capsule in the evening before meals).

The tianeptine dose fixed in blind condition at W2 according to clinical improvement (25 mg/day or 50 mg/day) remained unchanged during the tapering period (end of the study or in case of premature study discontinuation).

Arm title	Escitalopram
------------------	--------------

Arm description:

The tapering period was planned after W2 to avoid discontinuation symptoms of escitalopram as recommended in the SmPC of escitalopram. Only escitalopram dose was decreased during this period.

Arm type	Active control to assay sensitivity
----------	-------------------------------------

Investigational medicinal product name	Escitalopram
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Capsule
Routes of administration	Oral use

Dosage and administration details:

Capsule of 5 mg or 10 mg of escitalopram or placebo, taken orally twice daily (one escitalopram capsule in the morning and one placebo capsule in the evening before meals).

From W2, all patients received 10 mg/day. After W2, a one-week tapering period at 5 mg/day was planned to avoid possible withdrawal reactions.

Arm title	Placebo
------------------	---------

Arm description:

The tapering period planned to follow the SmPC of escitalopram was in blind condition.

Arm type	Placebo
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Capsule
Routes of administration	Oral use

Dosage and administration details:

One capsule taken orally twice daily (one capsule in the morning and one capsule in the evening before meals).

Primary: HAM-D total score (main analysis)

End point title	HAM-D total score (main analysis)
End point description:	
The treatment difference between tianeptine and placebo was studied in the FAS from the HAM-D total score expressed in terms of change from baseline to W8, using a two-way analysis of covariance (ANCOVA) model (including the three treatment groups).	

Analysis include the fixed, categorical effects of treatment, the random categorical effect of centre as well as the continuous, fixed covariate of baseline HAM-D total score.

Missing data at W8 were imputed using LOCF approach.

End point type	Primary
----------------	---------

End point timeframe:

The primary efficacy criterion was the HAM-D 17 total score expressed mainly in term of change from baseline to W8.

End point values	Tianeptine	Escitalopram	Placebo

sides	2-sided
lower limit	2.39
upper limit	5.79
Variability estimate	Standard error of the mean
Dispersion value	0.86

Notes:

[4] - Analysis of covariance model on factors treatment and centre (random effect) with baseline HAM-D total score as covariate.

Primary: HAM-D total score (sensitivity analysis)

End point title	HAM-D total score (sensitivity analysis)
-----------------	--

End point description:

Sensitivity analysis to the method of handling missing data: MMRM analysis in all patients of the FAS. Tianeptine and escitalopram were compared to placebo in the FAS on the change from baseline to W8 of HAM-D total score, using a restricted maximum likelihood (REML)-based, mixed-effects repeated measures approach (MMRM) using all the longitudinal observations at each post-baseline visit (W2, W4, W6 and W8) expressed as change from baseline. Analysis included the fixed, categorical effects of treatment, visit and treatment-by-visit interaction, the random categorical effect of centre as well as the continuous, fixed covariate of baseline.

End point type	Primary
----------------	---------

End point timeframe:

The primary efficacy criterion was the HAM-D 17 total score expressed mainly in term of change from baseline to W8.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
16 December 2013	<p>Applicable to all countries.</p> <p>It mainly concerned the implementation of the changes related to the revision (dated 02 October 2013) of escitalopram SmPC. According to this revision, one non selection or non-inclusion criterion was added for patients with angle-close glaucoma or history of glaucoma and a caution was warranted for concomitant use of medicinal products inducing hypokalaemia/hypomagnesaemia as these conditions increased the risk of malignant arrhythmias with study drugs.</p> <p>One other change implemented with this amendment was the update of the Declaration of Helsinki to be in accordance with the revised version of Fortaleza, October 2013.</p> <p>Secondary objectives of this amendment were to complete or correct the following information:</p> <ul style="list-style-type: none">- Conditions of storage of the treatments.- Antihistamines with central effects in the list of forbidden treatments due to their possible action on the central nervous system.- Doses of the benzodiazepines authorized as concomitant medications (equivalent to 10 mg of diazepam).- Collected blood volumes and interpretation of hepatitis B serology status.- Use of the computerized medical file.- MINI and CGI scales according to the final e-CRF format.
22 October 2014	<p>Three countries participating to the study were added (Bulgaria, Poland and South Africa) and one country was removed (Argentina).</p>

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats
