Scientific contact	Manal Morsy, ReGenesys, BVBA, 1 2162153071, mmorsy@regenesys.eu

Notes:

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	07 December 2015
Is this the analysis of the primary completion data?	Yes
Primary completion date	07 December 2015
Global end of trial reached?	Yes
Global end of trial date	07 December 2015
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary objectives of this study are to:

-To determine the highest well tolerated and safest single dose of MultiStem up to a maximum of 1200 million (1.2 billion) total cells in subjects with ischemic stroke

-To determine the efficacy of MultiStem on stroke recovery in subjects with ischemic stroke.

Protection of trial subjects:

An Independent Safety Committee with multidisciplinary representation evaluated accumulating trial data and assessed the ongoing safety of the trial for the subjects enrolled. Following each data review, the Independent Safety Committee made a recommendation to the sponsor regarding continuation, revision of dosage, or termination of the trial.

The study was conducted in compliance with Good Clinical Practice, an international ethical and scientific quality standard for designing, conducting, recording, and reporting trials that involve human subjects. Compliance with this standard provides public assurance that the rights, safety, and well being of trial subjects are protected, consistent with the principles that have their origin in the Declaration of Helsinki, and that the clinical trial data are credible.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	24 October 2011
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	United States: 131
Country: Number of subjects enrolled	United Kingdom: 6
Worldwide total number of subjects	137
EEA total number of subjects	0

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0

Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	80
From 65 to 84 years	57
85 years and over	0

Subject disposition

Recruitment

Recruitment details: -

Pre-assignment

Screening details:

Patients 18–79 years with a moderately severe ischaemic stroke with motor or speech deficit defined by a National Institutes of Health Stroke Scale (NIHSS) score of 8–20 at baseline just before administration (≥ 24 h).

Pre-assignment period milestones

Number of subjects started	137
----------------------------	-----

Number of subjects completed	134
------------------------------	-----

Pre-assignment subject non-completion reasons

Reason: Number of subjects	Consent withdrawn by subject: 3
----------------------------	---------------------------------

Period 1

Period 1 title	Overall trial (overall period)
----------------	--------------------------------

Is this the baseline period?	Yes
------------------------------	-----

Allocation method	Randomised - controlled
-------------------	-------------------------

Blinding used	Double blind
---------------	--------------

Roles blinded	Subject, Investigator, Monitor, Data analyst, Carer, Assessor
---------------	---

Arms

Are arms mutually exclusive?	Yes
------------------------------	-----

Primary: Global Stroke Recovery

End point title	Global Stroke Recovery ^{[1][2]}
End point description: The primary efficacy outcome was the multivariate global stroke recovery at day 90, which assesses global disability, neurological deficit, and activities of daily living and consists of mRS 2 or less; NIHSS total score improvement of 75% or more from baseline; and Barthel index of 95 or more in the multipotent adult progenitor cells treatment group, compared with the placebo treatment. The data from these three binary variables from each patient were analysed with an additive logistic regression model with the treatment group and baseline NIHSS score (≤ 12 or ≥ 13) as dependent variables.	
End point type	Primary
End point timeframe: Day 90	

Notes:

[1] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: Primary and secondary efficacy endpoints are reported for all subjects receiving investigational product at the target dose of 1.2 billion cells (or match placebo) - Cohorts 2 and 3 combined.

[2] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.

Justification: Primary and secondary efficacy endpoints are reported for all subjects receiving investigational product at the target dose of 1.2 billion cells (or match placebo) - Cohorts 2 and 3 combined.

Notes:

[13] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.

Justification: Primary and secondary efficacy endpoints are reported for all subjects receiving investigational product at the target dose of 1.2 billion cells (or match placebo) - Cohorts 2 and 3 combined.

End point values	Cohort 2/3 Placebo	Cohort 2/3 1.2 billion cells	Cohort 2/3 Placebo Excluding Dual Reperfusion Therapy	Cohort 2/3 Original Trial Protocol - MultiStem
Subject group type	Reporting group	Reporting group	Subject analysis set	Subject analysis set
Number of subjects analysed	61	65	52	27
Units: Subjects				
Barthel Index \geq 95	27	40	22	19

End point values	Cohort 2/3 Early Treatment - Placebo	Cohort 2/3 Early Treatment - MultiStem		
Subject group type	Subject analysis set	Subject analysis set		
Number of subjects analysed	19	31		
Units: Subjects				
Barthel Index \geq 95	10	21		

Statistical analyses

No statistical analyses for this end point

Secondary: mRS ≤ 1

End point title	mRS ≤ 1 ^[14]
End point description: Number of subjects obtaining mRS outcome of ≤ 1 at 1 year assessment.	
End point type	Secondary
End point timeframe: 1 year	

Notes:

[14] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.

Justification: Primary and secondary efficacy endpoints are reported for all subjects receiving investigational product at the target dose of 1.2 billion cells (or match placebo) - Cohorts 2 and 3 combined.

NIHSS \leq 1	4	11		

Statistical analyses

No statistical analyses for this end point

Secondary: Excellent outcome

End point title	Excellent outcome ^[16]
-----------------	-----------------------------------

End point description:

Number of subjects achieving Excellent Outcome at 1 year. Defined as a composite of mRS \leq 1, NIHSS \leq 1, and Barthel Index \geq 95.

End point type	Secondary
----------------	-----------

End point timeframe:

1 year

Notes:

[16] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.

Justification: Primary and secondary efficacy endpoints are reported for all subjects receiving investigational product at the target dose of 1.2 billion cells (or match placebo) - Cohorts 2 and 3 combined.

End point values	Cohort 2/3 Placebo	Cohort 2/3 1.2 billion cells	Cohort 2/3 Placebo Excluding Dual Reperfusion Therapy	Cohort 2/3 Original Trial Protocol - MultiStem
Subject group type	Reporting group	Reporting group	Subject analysis set	Subject analysis set
Number of subjects analysed	61	65	52	27
Units: Subjects				
Excellent outcome	5	15	3	8

End point values	Cohort 2/3 Early Treatment - Placebo	Cohort 2/3 Early Treatment - MultiStem		
Subject group type	Subject analysis set	Subject analysis set		
Number of subjects analysed	19	31		
Units: Subjects				
Excellent outcome	0	9

Adverse events

Adverse events information^[1]

Timeframe for reporting adverse events:

Through Day 365

Adverse event reporting additional description:

There were no dose-limiting toxicity events in either group. There were no infusional or allergic reactions and no difference in treatment-emergent adverse events between the groups (64 [99%] of 65 patients in the multipotent adult progenitor cell group vs 59 [97%] of 61 in the placebo group).

Assessment type	Non-systematic
-----------------	----------------

Dictionary used

Dictionary name	MedDRA
-----------------	--------

Dictionary version	14.1
--------------------	------

Frequency threshold for reporting non-serious adverse events: 5 %

Notes:

[1] - There are no non-serious adverse events recorded for these results. It is expected that there will be at least one non-serious adverse event reported.

Justification: Treatment-emergent adverse events (serious and non-serious) were not different between the multipotent adult progenitor cells and placebo arms. There was also no difference in the incidence of serious adverse events between the arms. Mortality was not different between the arms (5 [8%] patients died in the multipotent adult progenitor cell group vs 9 [15%] patients died in the placebo group; $p=0.21$). See attached Lancet Neurology publication from 2017 for more details describing safety endpoints

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
26 July 2013	<p>In response to lower-than-expected enrolment rates in the early stages of the study, the protocol's inclusion and exclusion criteria were amended to broaden the eligible patient population:</p> <ul style="list-style-type: none">• The upper age limit was increased from 79 years to 83 years.• The treatment window was expanded from 24–36 h to 24–48 h after stroke onset to better accommodate limited hours of operations of cell processing laboratories needed to prepare the investigational, first-generation MultiStem product configuration used in this study• Allowed inclusion of patients receiving both tPA treatment and endovascular thrombectomy to accommodate evolving standards of care that included increasing use of endovascular thrombectomy following thrombolysis.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
