General information about the trial

Main objective of the trial:

The primary objective of this study was to demonstrate that rivaroxaban was superior to placebo in subjects with heart failure (HF) and significant coronary artery disease (CAD), who were receiving standard care, in reducing the risk of the composite of all-cause mortality (ACM), myocardial infarction (MI), or stroke following an index event.

Protection of trial subjects:

This study was conducted in accordance with the ethical principles that have their origin in the Declaration of Helsinki and that are consistent with Good Clinical Practices (GCP) and applicable regulatory requirements. Safety was assessed by the evaluation of the principal safety outcome, other bleeding outcomes, Adverse Events and laboratory evaluations.

End point title	Event Rate of Either Fatal Bleeding or Bleeding into a Critical Space with Potential for Permanent Disability
-----------------	---

End point description:

Event rate of either fatal bleeding or bleeding into critical space with potential for permanent disability were assessed. Fatal bleeding event was death within 7 days after bleeding event which required hospitalization or met ISTH major bleeding definition criteria. Fatal bleeding event included that met criteria in 3 1: Any ISTH major bleeding event considered to be primary cause of death by investigator; 2: ISTH major bleeding event not considered primary cause of death by investigator but resulted in death within 7 days; 3: Any bleeding event resulted in hospital and death within 7 days. Bleeding with potential for permanent disability included 7 critical spaces: intracranial, intraspinal, intraocular. Event rate based on time to first occurrence of event were reported in the study. Event Rate/(100 pt-yr)=100*n/(total risk exposure), where n is number of events. SAS: subjects who received at least one dose of study drug. 'N': number of subjects evaluable for this outcome measure.
