

## Clinical trial results:

### Open-Label, Phase IIIb Study to Evaluate the Efficacy and Safety of Subcutaneous (SC) Tocilizumab Monotherapy or Combination Therapy with Methotrexate (MTX) or Other Non-Biologic Disease Modifying Anti-Rheumatic Drugs (DMARDs) in Patients With Active Rheumatoid Arthritis (RA) Who Have an Inadequate Response to Current Non-Biologic DMARD Therapy or the First Anti-Tumour Necrosis Factor (Anti-TNF) Biologic Agent

#### Summary

EudraCT number	2013-000054-22
Trial protocol	GB
Global end of trial date	04 August 2016

#### Results information

Result version number	v2 (current)
This version publication date	10 June 2018
First version publication date	21 July 2017
Version creation reason	

#### Trial information

##### Trial identification

Sponsor protocol code	ML28641
-----------------------	---------

##### Additional study identifiers

ISRCTN number	-
ClinicalTrials.gov id (NCT number)	NCT02046603
WHO universal trial number (UTN)	-
Other trial identifiers	Hoffmann-La Roche: ACT-MOVE

Notes:

#### Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

## Results analysis stage

Analysis stage	Final
Date of interim/final analysis	04 August 2016
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	04 August 2016
Was the trial ended prematurely?	No

Notes:

## General information about the trial

Main objective of the trial:

The primary objective was to assess the efficacy of switching to subcutaneous (SC) tocilizumab (as monotherapy or in combination with methotrexate or other non-biologic disease modifying antirheumatic drugs [DMARDs]) in participants who had an inadequate response to current non-biologic methotrexate therapy or the first anti-tumor necrosis factor (anti-TNF) biologic agent (as monotherapy or in combination with methotrexate or other non-biologic DMARDs).

Protection of trial subjects:

The study was conducted in accordance with the principles of the Declaration of Helsinki and International Council for Harmonisation Good Clinical Practice according to the regulations and procedures described in the study protocol.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	04 March 2014
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

## Population of trial subjects

### Subjects enrolled per country

Country: Number of subjects enrolled	United Kingdom: 161
Worldwide total number of subjects	161
EEA total number of subjects	161

Notes:

### Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0

Adults (18-64 years)	126
From 65 to 84 years	35
85 years and over	0

## Subject disposition

### Recruitment

Recruitment details: -

### Pre-assignment

Screening details:

A total of 162 participants were enrolled. One participant who did not receive a dose of tocilizumab was excluded from the full analysis set (FAS) and the results are reported for 161 participants.

### Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Not applicable
Blinding used	Not blinded

### Arms

Are arms mutually exclusive?	Yes
<b>Arm title</b>	Tocilizumab Monotherapy

Arm description:

Participants received a weekly SC injection of tocilizumab 162 milligrams (mg) as monotherapy for 52 weeks.

Arm type	Experimental
Investigational medicinal product name	Tocilizumab
Investigational medicinal product code	
Other name	RoActemra, Actemra
Pharmaceutical forms	Solution for injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Tocilizumab 162 mg was administered once a week by SC injection and as a single fixed dose, irrespective of body weight, for the treatment duration of 52 weeks.

<b>Arm title</b>	Tocilizumab in Combination With Methotrexate or Other DMARDs
------------------	--

Arm description:

Participants received a weekly SC injection of tocilizumab 162 mg in combination with methotrexate or other non-biologic DMARDs for 52 weeks.

Arm type	Experimental
Investigational medicinal product name	Tocilizumab
Investigational medicinal product code	
Other name	RoActemra, Actemra
Pharmaceutical forms	Solution for injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Tocilizumab 162 mg was administered once a week by SC injection and as a single fixed dose, irrespective of body weight, for the treatment duration of 52 weeks.

Number of subjects in period 1	Tocilizumab Monotherapy	Tocilizumab in Combination With Methotrexate or Other DMARDs
Started	21	140
Completed	7	65
Not completed	14	75
Participant/legal guardian decision	1	3
Physician decision	1	1
Adverse Event	-	1
Death	-	1
Unspecified	11	66
Lost to follow-up	1	2
Protocol deviation	-	1

## Baseline characteristics

### Reporting groups

Reporting group title	Tocilizumab Monotherapy
-----------------------	-------------------------

Reporting group description:

Participants received a weekly SC injection of tocilizumab 162 milligrams (mg) as monotherapy for 52 weeks.

Reporting group title	Tocilizumab in Combination With Methotrexate or Other DMARDs
-----------------------	--

Reporting group description:

Participants received a weekly SC injection of tocilizumab 162 mg in combination with methotrexate or other non-biologic DMARDs for 52 weeks.

Reporting group values	Tocilizumab Monotherapy	Tocilizumab in Combination With Methotrexate or Other DMARDs	Total
Number of subjects	21	140	161
Age Categorical Units: Subjects			

Age Continuous Units: years arithmetic mean standard deviation	53.9 ± 13.63	55.3 ± 10.76	-
Gender Categorical Units: Subjects			
Female	16	104	120
Male	5	36	41

## End points

### End points reporting groups

Reporting group title	Tocilizumab Monotherapy
Reporting group description: Participants received a weekly SC injection of tocilizumab 162 milligrams (mg) as monotherapy for 52 weeks.	
Reporting group title	Tocilizumab in Combination With Methotrexate or Other DMARDs
Reporting group description: Participants received a weekly SC injection of tocilizumab 162 mg in combination with methotrexate or other non-biologic DMARDs for 52 weeks.	

### Primary: Change From Baseline in Disease Activity Score 28-Erythrocyte Sedimentation Rate (DAS28-ESR) at Week 2

End point title	Change From Baseline in Disease Activity Score 28-Erythrocyte Sedimentation Rate (DAS28-ESR) at Week 2 <sup>[1]</sup>
End point description: DAS28 was calculated from swollen joint count (SJC) and tender joint count (TJC) using 28 joints count, erythrocyte sedimentation rate (ESR; millimeters per hour [mm/hour]), and patient's global assessment of disease activity (measured on 0 to 100 mm Visual Analog Scale [VAS] where 0 mm=no disease activity and 100 mm=worst disease activity). DAS28 scores were calculated as $[0.56 \times \text{square root of TJC}] + [0.28 \times \text{square root of SJC}] + [0.70 \times \text{natural log (ESR)}] + [0.014 \times \text{VAS}]$ . Total score range: 0-10, higher score=higher disease activity. DAS28-ESR greater than or equal to ( $\geq$ ) 2.6 to less than or equal to ( $\leq$ ) 3.2 implied low disease activity, greater than ( $>$ ) 3.2 to $\leq 5.1$ implied moderate disease activity, $>5.1$ implied high/severe disease, and less than ( $<$ ) 2.6 implied clinical remission. FAS population included all participants who received at least 1 dose of SC tocilizumab. "Number of subjects analysed"=participants evaluable for this outcome. "n"=participants evaluable at specified timepoint.	
End point type	Primary
End point timeframe: Baseline, Week 2	

#### Notes:

[1] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: No statistical analysis was planned for this end point.

## Statistical analyses

No statistical analyses for this end point

### Primary: Change From Baseline in DAS28-ESR at Week 48

End point title	Change From Baseline in DAS28-ESR at Week 48 <sup>[13]</sup>
-----------------	--

End point description:

DAS28 was calculated from SJC and TJC using 28 joints count, ESR (mm/hour), and patient's global assessment of disease activity (measured on a 0 to 100 mm VAS where 0 mm=no disease activity and 100 mm=worst disease activity). DAS28 scores were calculated as  $[0.56 \times \text{square root of TJC}] + [0.28 \times \text{square root of SJC}] + [0.70 \times \text{natural log (ESR)}] + [0.014 \times \text{VAS}]$ . Total score range: 0-10, higher score=higher disease activity. DAS28-ESR  $\geq 2.6$  to  $\leq 3.2$  implied low disease activity,  $>3.2$  to  $\leq 5.1$  implied moderate disease activity,  $>5.1$  implied high/severe disease, and  $<2.6$  implied clinical remission. FAS population. Here, "Number of subjects analysed" = participants who were evaluable for this outcome.

### Secondary: Number of Participants With European League Against Rheumatism (EULAR) Response (Good, Moderate or No Response) Based on DAS28-ESR

End point title	Number of Participants With European League Against Rheumatism (EULAR) Response (Good, Moderate or No Response) Based on DAS28-ESR
-----------------	--

End point description:

DAS28-ESR was calculated from SJC and TJC using 28 joints count, ESR (mm/hour), and patient's global assessment of disease activity (VAS: 0 mm=no disease activity to 100 mm=maximum disease activity). DAS28-ESR scores were calculated as  $[0.56 \times \text{square root of TJC}] + [0.28 \times \text{square root of SJC}] + [0.70 \times \text{natural log (ESR)}] + [0.014 \times \text{VAS}]$ . DAS28-ESR based EULAR response criteria were used to measure individual response as none, good, and moderate, depending on extent of change from baseline and level of disease activity reached. Good responders had a change from baseline  $>1.2$  with a DAS28 score  $\leq 3.2$ ; moderate responders had a change from baseline  $>1.2$  with a DAS28 score  $>3.2$  or a change from baseline  $>0.6$  to  $\leq 1.2$  with a DAS28 score  $\leq 5.1$ . Participants with change from baseline  $>0.6$  to  $\leq 1.2$  with a DAS28 score  $>5.1$ , or any score with change from baseline  $\leq 0.6$ , were assessed as non-responders. FAS population. "n"=participants who were evaluable at specified timepoint for respective groups.

## Secondary: Percent Change From Baseline in Total TJC on 68 Joints at Week 52

End point title	Percent Change From Baseline in Total TJC on 68 Joints at Week 52
-----------------	---

End point description:

Number of tender joints was determined by examining 68 joints and identified the joints that were painful under pressure or to passive motion. The number of tender joints was recorded on the joint assessment form at each visit, no tenderness = 0, tenderness = 1; total was calculated by adding all the joints for a maximum score of 68. A reduction in number of tender joints compared to baseline indicates improvement. The outcome is reported as the percent change from baseline to end of treatment (52 weeks). FAS population. Here, "Number of subjects analysed" = participants who were evaluable for this outcome.

### Secondary: Percentage of Methotrexate Adherence as Assessed by Methotrexate Adherence Questionnaire

End point title	Percentage of Methotrexate Adherence as Assessed by Methotrexate Adherence Questionnaire <sup>[16]</sup>
-----------------	--

End point description:

Methotrexate adherence was determined from responses to the question 'Over the last 3 months you were prescribed 12 doses of methotrexate, how many (approximately) have you taken?' Adherence (%) was calculated as: (Approximate number of doses taken/12)\*100. FAS population. Here, "Number of subjects analysed" = participants who were evaluable for this outcome. "n" = participants who were evaluable at specified timepoint for respective groups.

End point type	Secondary
----------------	-----------

End point timeframe:

Baseline, Weeks 12, 24, 36, 52, and at early withdrawal (up to Week 52)

Notes:

[16] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.

Justification: No statistical results are provided for single arm as participants in "Tocilizumab Monotherapy" arm did not receive methotrexate. I analysis was planned for this end point.

End point values	Tocilizumab in Combination With Methotrexate or Other DMARDs			
Subject group type	Reporting group			
Number of subjects analysed	97

**Secondary: Health Assessment Questionnaire-Disability Index (HAQ-DI) Score**

End point title	Health Assessment Questionnaire-Disability Index (HAQ-DI) Score
-----------------	---

**End point description:**

The HAQ-DI questionnaire measures functional status (disability) and health-related quality of life. It measures the participant's ability to perform everyday tasks. The index consists of 20 questions regarding the function of the upper and lower extremities. These questions are summarized in 8 categories: dressing and grooming, arising, eating, walking, hygiene, reach, grip, and common activities over past week. Each question is evaluated according to the degree of severity on a 4-point scale. Total score for HAQ-DI was the average of all questions and ranges from 0 = without any difficulty to 3 = unable to do. FAS population. "n" = participants who were evaluable at specified timepoint for

respective groups.

## Secondary: Functional Assessment of Chronic Illness Therapy-Fatigue (FACIT-F) Score

End point title	Functional Assessment of Chronic Illness Therapy-Fatigue (FACIT-F) Score
-----------------	--

### End point description:

The FACIT-F score was calculated according to a 13-item questionnaire that assesses self-reported fatigue and its impact upon daily activities and function. FACIT-F is a 13-item questionnaire. Participants scored each item on a 5-point scale: 0 (Not at all) to 4 (Very much). The larger the participant's response to the questions (with the exception of 2 negatively stated), the greater the participant's fatigue. For all questions, except for the 2 negatively stated ones, the code was reversed and a new score was calculated as (4 minus the participant's response). The sum of all responses resulted in the FACIT-F score for a total possible score of 0 (worse score) to 52 (better score). FAS population. "n" = participants who were evaluable at specified timepoint for respective groups.

## More information

### Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
23 September 2013	The major changes were corrections to ensure consistent wording for participant withdrawal criteria throughout the protocol and clarification regarding post-study follow-up visits. Minor formatting changes were also made to improve clarity and consistency.
06 May 2014	The major changes were the reduction in sample size from 260 participants to 160 participants, expansion of the target population to include those participants who had not experienced an adequate response to their current non-biologic DMARD therapy or the first anti-TNF agent and clarification that eligible participants were required to have "active" (not severe) rheumatoid arthritis. The reduction in sample size only increased the 95% confidence interval (CI) width by 0.09 for ESR and by 0.8 for CDAI. The expected precision of the CI widths around the mean change from baseline for a sample of 160 participants was still deemed to be clinically sufficient and a reasonable target to be able to draw conclusions from the study. The addition of DMARD inadequate response participants was not expected to compromise the power of the study as data from other studies indicate their responses are no worse and not more variable than those of the original study population. Details regarding study treatment, concomitant medications and assessments were updated for clarification. Administrative changes and additional minor changes were made to improve clarity and consistency.
10 December 2014	The major change was amendment of the target participant population to remove the window (previously 12 to 32 weeks) during which a participant who was receiving their first anti-TNF therapy would have to be assessed for an inadequate response to anti-TNF treatment. The rationale for this change was based on the feedback received from the sites, which indicated that such a protocol requirement was extremely difficult to implement and not aligned with local hospital protocols for assessing inadequate response to anti-TNF treatment. It was also clarified that inadequate response to non-biologic DMARD therapy was to be assessed according to local guidelines and that participants needed to be eligible for biologic therapy according to local guidelines. Language regarding pregnancy testing was also clarified in this amendment and names of relevant Roche personnel were updated. Additional minor changes were made to improve clarity and consistency.

Notes:

### Interruptions (globally)

Were there any global interruptions to the trial? No

### Limitations and caveats

None reported
