

Clinical trial results:

Sub-cutaneous Rituximab-miniCHOP versus Sub-cutaneous Rituximab-miniCHOP + lenalidomide (R2-miniCHOP) in Diffuse Large B Cell Lymphoma for patients of 80 years old or more. A multicentric phase III study of the LYSA.

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	28 July 2021
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	07 February 2021
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

Primary objective of the study is to compare the efficacy of R2-miniCHOP and R-miniCHOP in patients \geq 80 years with not previously treated CD20+ diffuse large B-cell lymphoma as measured by the overall survival (OS)

Protection of trial subjects:

In case of deep vein thrombosis (DVT) occurrence, antithrombotic treatment (heparin or Coumadin [INR 2-3]) must be started (and kept during the whole treatment duration with lenalidomide) and lenalidomide can be resumed without dose reduction.

If DVT is not resolved or in case of DVT recurrence, lenalidomide must be stopped and the decision of maintaining the R-miniCHOP regimen stays at the investigator's discretion.

Background therapy:

R-miniCHOP

Evidence for comparator:

In Phase II study of the GELA group involving patients older than 80 years, the efficacy and safety of a decreased dose of CHOP (doxorubicin, cyclophosphamide, vincristine, and prednisone) chemotherapy with a conventional dose of rituximab (R-miniCHOP) was recently investigated. After a median follow-up of 20 months, analysis by intention to treat of the 149 included patients demonstrated a 2-year overall survival of 59%, a 2-year PFS of 47% and a median progression-free survival of 21 months. The most frequent side-effect was haematological toxicity (grade \geq 3 neutropenia in 40% of cases) but with infrequent febrile neutropenia (7%) indicating that R-miniCHOP displays a good compromise between efficacy and safety in this population¹⁰. This regimen can be considered as the current gold standard for fit patients older than 80 years. According to further multivariate analysis performed for this study (not published), survival of patients less than 85 years was significantly different from patients aged of more than 85 years old. Similar results were obtained in a 70% CHOP reduction regimen for patients older than 70, displaying a 3-year PFS of 72% and a 3-year OS of 58%²¹. Activity and safety of dose-adjusted infusional cyclophosphamide, doxorubicin, vincristine, and prednisone chemotherapy (DA-EPOCH) with rituximab in elderly patients with poor-prognostic untreated DLBCL has been also proposed in frail patients older than 70 years.

To date, the R-miniCHOP (with rituximab IV) regimen is the standard of care for fit DLBCL patients > 80y and will be the standard arm of the trial.

Actual start date of recruitment	31 March 2014
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Portugal: 1
Country: Number of subjects enrolled	Belgium: 11
Country: Number of subjects enrolled	France: 237

Worldwide total number of subjects	249
EEA total number of subjects	249

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	0
From 65 to 84 years	188
85 years and over	61

Subject disposition

Recruitment

Recruitment details:

250 patients were randomized at 71 study centers in France, Belgium and Portugal from August 20th, 2014 to September 13th, 2017.

Pre-assignment

Screening details:

In both arms, before the start of the treatment and after randomization, a pre-phase treatment was administered to the patients one week before D1 of chemotherapy.

Chemotherapy regimen :

-Prednisone 60 mg/m² at D-7 D-6 D-5 D-4

-Vincristine 1 mg TD at D-7

Period 1

Period 1 title	Pre-Phase
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	R-mini chop

Arm description:

Standard Arm : All patients will be treated with R-miniCHOP at a three-weeks interval for 6 cycles

CYCLOPHOSPHAMIDE IV (400 mg/m² at D1)

DOXORUBICINE IV (25 mg/m² at D1)

VINCRIStINE IV (1 mg TD at D1)

PREDNISONE PO (40 mg/m² from D1 to D5)

RITUXIMAB SC* (1400 mg TD at D1)

*The first cycle of rituximab is delivered by IV at the dose of 375 mg/m²

Arm type	Standard
Investigational medicinal product name	VINCRIStINE
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Intravenous use

Dosage and administration details:

1 mg TD

median (inter-quartile range (Q1-Q3))	43.5 (0.3 to 51.1)	0 (0 to 48.5)		

Statistical analyses

Statistical analysis title	Comparison of Overall survival
----------------------------	--------------------------------

Statistical analysis description:

Treatment with R2-miniCHOP will be declared superior if the one-sided p-value from unstratified log-rank

test is < 0.05. Hazard ratio with two-sided 95% confidence intervals will be estimated using the Cox proportional hazards model if proportional hazard assumption holds. Graphical display of Kaplan-Meier curves will be provided to aid data interpretation visually

Comparison groups	R-mini chop v R2-minichop
Number of subjects included in analysis	249
Analysis specification	Pre-specified
Analysis type	superiority ^[1]
P-value	= 0.98
Method	Logrank
Parameter estimate	Hazard ratio (HR)
Point estimate	0.996
Confidence interval	
level	95 %
sides	1-sided
upper limit	1.509

Notes:

[1] - A one-sided log-rank test will be used for testing the difference in overall survival between the two treatment groups. The significance level for the primary analysis will be 0.05.

The hypothesis will be:

H0: OS (R2-miniCHOP) = OS (R--miniCHOP)

Versus

HA: OS (R2-miniCHOP) ≥ OS (R-miniCHOP)

Where OS denotes the survival distribution of the parameter time to overall survival.

For secondary parameters, statistical tests will be two-sided and performed using a 5% level of significance
