

Clinical trial results:

Corticosteroids or clobazam for ESES syndrome: a European, multicenter, randomized, controlled clinical trial

Summary

EudraCT number	2013-000531-27
Trial protocol	NL FI ES BE DE GB FR DK IT
Global end of trial date	21 May 2022

Results information

Result version number	v1 (current)
This version publication date	20 April 2024
First version publication date	20 April 2024

Trial information

Trial identification

Sponsor protocol code	NL43510
-----------------------	---------

Additional study identifiers

ISRCTN number	ISRCTN42686094
ClinicalTrials.gov id (NCT number)	-
WHO universal trial number (UTN)	-
Other trial identifiers	Dutch CCMO ABR number: 43510

Notes:

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	21 August 2023
Is this the analysis of the primary completion data?	Yes
Primary completion date	10 February 2022
Global end of trial reached?	Yes
Global end of trial date	21 May 2022
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

To compare the effects on cognition of treatment with either corticosteroids or clobazam in children with ESES syndrome

Protection of trial subjects:

Yes, by means of proper informed consent forms and a data management plan

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	01 January 2014
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Netherlands: 29
Country: Number of subjects enrolled	Spain: 1
Country: Number of subjects enrolled	United Kingdom: 1
Country: Number of subjects enrolled	Denmark: 3
Country: Number of subjects enrolled	Finland: 5
Country: Number of subjects enrolled	France: 4
Country: Number of subjects enrolled	Germany: 2
Worldwide total number of subjects	45
EEA total number of subjects	44

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	45
Adolescents (12-17 years)	0

Adults (18-64 years)	0
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

The study protocol and amendments were reviewed and approved by independent ethics committees or institutional review boards in agreement with local requirements. All parents or legal representatives of children provided written informed consent before enrolment

Pre-assignment

Screening details:

Patients fulfilling the eligibility criteria were consecutively selected by paediatric neurologists during admission or visits at the outpatient clinic at the participating centres. In addition, basic characteristics of patients that were not included in the study despite fulfilment of the eligibility criteria were collected

Period 1

Period 1 title	T0
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

Blinding implementation details:

Participants were randomly assigned (1:1) to treatment with corticosteroids or clobazam. Participants and treating physicians were not masked to the treatment assignment, because of the inherent differences in mode of administration and expected adverse effects between treatment groups. The neuropsychologists and neurophysiologist (EEG readers) who evaluated the outcome were masked to treatment assignment

Arms

Are arms mutually exclusive?	Yes
Arm title	Corticosteroids

Arm description:

For participants allocated to corticosteroids, either intravenous pulse methylprednisolone or continuous oral prednisolone was given, according to local experience and the preference of each study centre. In the case of pulse methylprednisolone, the dose was 20 mg/kg given over 30 min once daily for 3 consecutive days then at 4-week intervals for 6 months. In the case of oral prednisolone, the dose was initially 2 mg/kg per day, to a maximum of 60 mg per day, for 1 month followed by 1–2 mg/kg per day (maximum 60 mg per day) for the next 5 months (dose decided by the treating physician).

Arm type	Active comparator
Investigational medicinal product name	Methylprednisolone
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Concentrate for solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

The dose was 20 mg/kg given over 30 min once daily for 3 consecutive days then at 4-week intervals for 6 months

Investigational medicinal product name	Oral prednisolone
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Capsule, hard + tablet

Routes of administration	Oral use
--------------------------	----------

Dosage and administration details:

The dose was initially 2 mg/kg per day, to a maximum of 60 mg per day, for 1 month followed by 1–2 mg/kg per day (maximum 60 mg per day) for the next 5 months (dose decided by the treating physician).

Arm title	Clobazam
------------------	----------

Arm description:

For participants allocated to clobazam, the oral dose was titrated to 0.5 mg/kg per day within 2 weeks. If well tolerated, the dose was increased to a maximum of 1.2 mg/kg, once daily. If the clobazam dose exceeded 20 mg per day, it could be divided in two daily oral administrations. Treatment was continued for at least 6 months. In both treatment groups, if the child developed intolerable adverse effects or further cognitive regression, addition of or replacement with an alternative intervention, including switching to the other treatment group, could be applied as required in the treating physician's opinion. After 6 months, treatment could either be continued or the dose tapered according to the treating physician's preference. Alternative treatment options, thereafter, were allowed

Arm type	Active comparator
Investigational medicinal product name	Clobazam
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

The oral dose was titrated to 0.5 mg/kg per day within 2 weeks. If well tolerated, the dose was increased to a maximum of 1.2 mg/kg, once daily. If the clobazam dose exceeded 20 mg per day, it could be divided in two daily oral administrations

Number of subjects in period 1	Corticosteroids	Clobazam
Started	22	23
Completed	22	23

Period 2

Period 2 title	T6
Is this the baseline period?	No
Allocation method	Randomised - controlled
Blinding used	Not blinded

Reporting groups

Reporting group title	Corticosteroids
-----------------------	-----------------

Reporting group description:

For participants allocated to corticosteroids, either intravenous pulse methylprednisolone or continuous oral prednisolone was given, according to local experience and the preference of each study centre. In the

case of pulse methylprednisolone, the dose was 20 mg/kg given over 30 min once daily for 3 consecutive days then at 4-week intervals for 6 months. In the case of oral prednisolone, the dose was initially 2 mg/kg per day, to a maximum of 60 mg per day, for 1 month followed by 1–2 mg/kg per day (maximum 60 mg per day) for the next 5 months (dose decided by the treating physician).

Reporting group title	Clobazam
-----------------------	----------

Reporting group description:

For participants allocated to clobazam, the oral dose was titrated to 0.5 mg/kg per day within 2 weeks. If well tolerated, the dose was increased to a maximum of 1.2 mg/kg, once daily. If the clobazam dose exceeded 20 mg per day, it could be divided in two daily oral administrations. Treatment was continued for at least 6 months. In both treatment groups, if the child developed intolerable adverse effects or further cognitive regression, addition of or replacement with an alternative intervention, including switching to the other treatment group, could be applied as required in the treating physician's opinion. After 6 months, treatment could either be continued or the dose tapered according to the treating physician's preference. Alternative treatment options, thereafter, were allowed

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? No

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

We did not reach the targeted sample size, which affects the robustness of the conclusions that can be drawn from the analysis of primary and secondary outcome measures
