

Clinical trial results:

Single dose, double-blind, placebo-controlled, single center, randomized cross-over study to investigate safety, tolerability, pharmacodynamics and pharmacokinetic properties of BAY-632521 after oral dosing of a 2 mg IR tablet in 20 subjects with Raynaud's phenomenon (RP)

Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary objective of the study was to investigate the safety, tolerability and pharmacodynamics of a single oral dose of riociguat (BAY63-2521) administered in subjects suffering from Raynaud's phenomenon.

Protection of trial subjects:

The conduct of this clinical study met all local legal and regulatory requirements. The study was conducted in accordance with the ethical principles that have their origin in the Declaration of Helsinki and the International Conference on Harmonization guideline E6: Good Clinical Practice. Before entering the study, the informed consent form was read by and explained to all subjects and/or their legally authorized representative. Participating subjects signed informed consent form and could withdraw from the study at any time without any disadvantage and without having to provide a reason for this decision. Only investigators qualified by training and experience were selected as appropriate experts to investigate the study drug.

Evidence for comparator: -

Actual start date of recruitment	07 October 2013
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Germany: 23
Worldwide total number of subjects	23
EEA total number of subjects	23

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0

Adults (18-64 years)	21
From 65 to 84 years	2
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

Study was conducted at one study center in Germany, between 07 October 2013 (first subject first visit) and 04 June 2014 (last subject last visit).

Pre-assignment

Screening details:

All 23 subjects who were randomized, received either placebo or riociguat treatment once, in a cross-over fashion, during the respective intervention periods.

Period 1

Period 1 title	Overall Trial (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Investigator, Carer, Subject, Assessor

Arms

Are arms mutually exclusive?	Yes
Arm title	Placebo – Riociguat (Adempas; BAY63-2521)

Arm description:

Subjects who followed treatment sequence placebo then riociguat (Adempas; BAY63-2521) were reported. Single oral dose of matching placebo in the first intervention period; followed by single oral dose of riociguat (Adempas; BAY63-2521) 2 milligram (mg) tablet in the second intervention period. A wash-out phase of 1 week was maintained between treatments.

Arm type	Experimental
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Each subject received a single oral dose of placebo matched to riociguat (BAY63-2521) during the first intervention period of the study.

Investigational medicinal product name	Riociguat
Investigational medicinal product code	BAY63-2521
Other name	Adempas
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Each subject received a single oral dose of 2 mg riociguat during the first intervention period of the study.

Arm title	Riociguat (Adempas; BAY63-2521)–Placebo
------------------	---

Arm description:

Subjects who followed treatment sequence riociguat (Adempas; BAY63-2521) then placebo were reported. Single oral dose of riociguat (Adempas; BAY63-2521) 2 mg tablet in the first intervention period; followed by single oral dose of matching placebo in the second intervention period. A wash-out phase of 1 week was maintained between treatments.

Primary: Number of Subjects with Treatment Emergent Adverse Events (TEAE)

End point title	Number of Subjects with Treatment Emergent Adverse Events (TEAE) ^[1]
End point description: An adverse event (AE) was any untoward medical occurrence in a subject who received study drug without regard to possibility of causal relationship. A serious adverse event (SAE) was an AE resulting in any of the following outcomes or deemed significant for any other reason: death; initial or prolonged inpatient hospitalization; life-threatening experience (immediate risk of dying); persistent or significant disability/incapacity; congenital anomaly and another medically important serious event as judged by the investigator. Treatment-emergent adverse events were defined as adverse events/serious adverse events that started or worsened after the study drug treatment.	
End point type	Primary
End point timeframe: From start of study drug administration until Day 7 (follow-up)

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? No

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

Occurrence of "±" in relation with geometric CV is autogenerated and cannot be deleted. '99999' in the posting indicates that data were not calculated. Decimal places were automatically truncated if last decimal equals zero.
