Notes:

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	Yes
EMA paediatric investigation plan number(s)	EMA-000081-PIP01-11
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	18 December 2019
Is this the analysis of the primary completion data?	Yes
Primary completion date	16 October 2019
Global end of trial reached?	Yes
Global end of trial date	14 November 2019
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The 2 main objectives were to assess the efficacy and safety of dabigatran etexilate (DE) relative to standard of care (SoC) and to document the appropriateness of the proposed DE dosing algorithm

Protection of trial subjects:

Only subjects that met all the study inclusion and none of the exclusion criteria were to be entered in the study. All subjects were free to withdraw from the clinical trial at any time for any reason given. Close monitoring of all subjects was adhered to throughout the trial conduct. Rescue medication was allowed for all patients as required.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	18 February 2014
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Argentina: 3
Country: Number of subjects enrolled	Austria: 4
Country: Number of subjects enrolled	Belgium: 6

Country: Number of subjects enrolled	Ukraine: 6
Country: Number of subjects enrolled	United States: 37
Worldwide total number of subjects	328
EEA total number of subjects	117

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	8
Infants and toddlers (28 days-23 months)	40
Children (2-11 years)	75
Adolescents (12-17 years)	205
Adults (18-64 years)	0
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

A multi-centre, open-label, randomised, parallel-group, active-controlled, non-inferiority trial of dabigatran etexilate (DE) versus standard of care (SoC) in children from birth to less than 18 years of age.

Pre-assignment

Screening details:

All subjects were screened for eligibility prior to participation in the trial. Subjects attended a specialist site which ensured that they (the subjects) strictly met all inclusion and none of the exclusion criteria. Subjects were not to be allocated to a treatment group if any of the entry criteria were violated.

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

Blinding implementation details:

It was an open-label trial

Arms

Are arms mutually exclusive?	Yes
Arm title	Dabigatran etexilate

Arm description:

Oral administration of dabigatran etexilate (DE) twice daily. Patients aged ≥ 8 years: age- and weight-adjusted DE dosing via capsules using 50 milligram (mg), 75 mg, 110 mg, and 150 mg capsules. Patients aged < 8 years or for patients who cannot take capsules even if older than 8 (but < 12 years of age): age- and weight-adjusted dosing via DE pellets. Patients aged < 12 months: age- and weight-adjusted dosing via DE oral liquid formulation (OLF).

Arm type	Experimental
Investigational medicinal product name	Dabigatran etexilate
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Oral liquid, Capsule, Granules
Routes of administration	Oral use

Dosage and administration details:

Oral administration of dabigatran etexilate (DE) twice daily. Patients aged ≥ 8 years: age- and weight-adjusted DE dosing via capsules using 50 milligram (mg), 75 mg, 110 mg, and 150 mg capsules. Patients aged < 8 years or for patients who cannot take capsules even if older than 8 (but < 12 years of age): age- and weight-adjusted dosing via DE pellets. Patients aged < 12 months: age- and weight-adjusted dosing via DE oral liquid formulation (OLF).

Arm title	Standard of care
------------------	------------------

Arm description:

Investigators decided on SoC treatment at time of randomisation: either low molecular weight heparin (LMWH) or vitamin K antagonists (VKA) or fondaparinux.

Arm type	Active comparator
Investigational medicinal product name	Low molecular weight heparin (LMWH) or vitamin K antagonists (VKA) or fondaparinux.
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Capsule, Injection
Routes of administration	Oral use, Subcutaneous use

Dosage and administration details:

Investigators decided on SoC treatment at time of randomisation: either low molecular weight heparin

(LMWH) or vitamin K antagonists (VKA) or fondaparinux.

Number of subjects in period 1 ^[1]	Dabigatran etexilate	Standard of care
Started	177	90
Treated	176	90
Completed	168	85
Not completed	9	5
Adverse event, non-fatal	1	2
Other reasons	3	2
Lost to follow-up	2	-
Not treated	1	-
Non-compliance with the CTP	2	1

Notes:

[1] - The number of subjects reported to be in the baseline period are not the same as the worldwide number enrolled in the trial. It is expected that these numbers will be the same.

Justification: This table is based on the randomized set and not on the subjects enrolled

Primary: Composite primary endpoint

End point title	Composite primary endpoint
End point description:	
The primary endpoint was the combined endpoint of the proportions of patients with: - Complete thrombus resolution - Freedom from recurrent VTE - Freedom from mortality related to VTE. The events outlined in the above combined primary endpoint were assessed by radiologists or other such qualified clinicians using an appropriate method such as ultrasound, echocardiography, venography, or CT scan, based on the location of the thrombus and the test used to perform the baseline assessment. The primary efficacy endpoint contained 3 components. Each component was evaluated separately, and only if the criteria for all 3 components were satisfied, the primary endpoint was considered achieved. The randomised set (RS) included all randomised patients in the treatment groups to which they were randomised, regardless whether they took trial medication	
End point type	Primary
End point timeframe:	
From the time of randomisation until Week 12, 84 days after randomisation including a visit window of 7 days.	

End point values	Dabigatran etexilate	Standard of care		
Subject group type	Reporting group	Reporting group		
Number of subjects analysed	177	90		
Units: Participants				
Complete thrombus resolution	81	38		
Freedom from recurrent VTE	170	83		
Freedom from mortality related to VTE	177	89		
Composite endpoint met	81	38		

Statistical analyses

Statistical analysis title	Primary endpoint analysis
Statistical analysis description:	
The primary analysis of the primary efficacy endpoint used the randomised set, following the intention-to-treat principle, based on adjudication-confirmed data. Age group was used as stratification factor	

using a Mantel-Haenszel type weighted average of differences.

Comparison groups	Dabigatran etexilate v Standard of care
Number of subjects included in analysis	267
Analysis specification	Pre-specified
Analysis type	
P-value	= 0.0001 ^[1]
Method	Cochran-Mantel-Haenszel
Parameter estimate	Difference in Rates
Point estimate	-0.038
Confidence interval	
level	90 %
sides	2-sided
lower limit	-0.141
upper limit	0.066

Notes:

[1] - p-value for non-inferiority is actually <0.0001

Secondary: Freedom from major bleeding events (MBEs)

End point title	Freedom from major bleeding events (MBEs)
End point description:	Freedom from major bleeding events (MBEs), defined as either fatal bleeding, clinically overt bleeding associated with a decrease in haemoglobin of at least 20 g/L in a 24-hour period, bleeding that is retroperitoneal, pulmonary, intracranial or otherwise involves the central nervous system, or bleeding that requires intervention in an operating suite. The treated set (TS) includes all patients who were dispensed trial medication and were documented to have taken at least 1 dose of trial medication
End point type	Secondary
End point timeframe:	From first administration of trial medication until last administration of trial medication +6 days (residual effect period).

End point values	Dabigatran etexilate	Standard of care		
Subject group type	Reporting group	Reporting group		
Number of subjects analysed	176	90		
Units: Kaplan-meier estimate				
arithmetic mean (confidence interval 90%)	0.977 (0.948 to 0.990)	0.977 (0.929 to 0.993)		

Statistical analyses

Statistical analysis title	Time-to-event analysis
Statistical analysis description:	Time-to-event endpoint using Kaplan-Meier estimates based on adjudication-confirmed data. Due to the low event rate of major bleeding, age group stratification was not considered.
Comparison groups	Dabigatran etexilate v Standard of care

Number of subjects included in analysis	266
Analysis specification	Pre-specified

Secondary: Assessment of the acceptability of an age-appropriate formulation at end of therapy (Capsules)

End point title	Assessment of the acceptability of an age-appropriate formulation at end of therapy (Capsules) ^[3]
-----------------	---

End point description:

Acceptability was defined as the overall ability and willingness of the patient to use the medicinal product. Questions regarding acceptability were to be answered by the patient and/or parent/caregiver (as applicable) and by the investigator/site staff. Investigator questionnaire capsules: What is your impression about the patient's acceptability of DE intake? The score is 1 (good), 2 (satisfactory), 3 (not satisfactory) and 4 (bad). Parents questionnaire capsules: How acceptable was the DE treatment for the child? The score is 1 (good), 2 (satisfactory), 3 (not satisfactory) and 4 (bad). Patients questionnaire

capsules: Was taking the study capsules easy or difficult? The score is 1 (Very easy), 2 (easy), 3 (neither easy nor difficult), 4 (difficult) and 5 (very difficult). Scores refers to the end of treatment. The treated set (TS) includes all patients who were dispensed trial medication and were documented to have taken at least 1 dose of trial medication.

End point type	Secondary
End point timeframe:	
Assessment at the last study visit	

Notes:

[3] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.

Justification: For this end point only the Dabigatran etexilate group was defined for the statistical analysis.

End point values	Dabigatran etexilate			
Subject group type	Reporting group			
Number of subjects analysed	119			
Units: Score				
arithmetic mean (standard deviation)				
Investigator questionnaire capsules	1.0 (\pm 0.2)			
Parents questionnaire capsules	1.0 (\pm 0.0)			
Patient questionnaire capsules	1.6 (\pm 0.9)			

Statistical analyses

No statistical analyses for this end point

Secondary: Assessment of the acceptability of an age-appropriate formulation at end of therapy (Pellets)

End point title	Assessment of the acceptability of an age-appropriate formulation at end of therapy (Pellets) ^[4]
-----------------	--

End point description:

Acceptability was defined as the overall ability and willingness of the patient to use the medicinal product. Questions regarding acceptability were to be answered by the patient and/or parent/caregiver (as applicable) and by the investigator/site staff. Investigator questionnaire pellets: What is your impression about the patient's acceptability of DE intake? The score is 1 (good), 2 (satisfactory), 3 (not satisfactory) and 4 (bad). Parents questionnaire pellets: Do you think that spitting occurs? The score is 1 (Never), 2 (sometimes) and 3 (often). Scores refers to the end of treatment. The treated set (TS) includes all patients who were dispensed trial medication and were documented to have taken at least 1 dose of trial medication

End point type	Secondary
End point timeframe:	
Assessment at the last study visit	

Notes:

[4] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.

Adverse events information

Timeframe for reporting adverse events:

For DE patients all AEs recorded between first dabigatran etexilate (DE) intake until 6 days after the last administration of dabigatran etexilate. The Open-label treatment period with DE or SOC is from visit 2 defined as day 0 up to 84 days.

Adverse event reporting additional description:

For patients in standard of care arm, all AEs occurred between the first drug intake of standard of care (SOC) until 6 days after the last administration of any standard of care. The treated set (TS) includes all patients who were dispensed trial medication and were documented to have taken at least 1 dose of trial medication

Assessment type	Systematic

Reporting groups

Reporting group title	Standard of care
-----------------------	------------------

Reporting group description:

Investigators decided on SoC treatment at time of randomisation: either low molecular weight heparin (LMWH) or vitamin K antagonists (VKA) or fondaparinux.

Reporting group title	Dabigatran etexilate
-----------------------	----------------------

Reporting group description:

Oral administration of dabigatran etexilate (DE) twice daily. Patients aged ≥ 8 years: age- and weight-adjusted DE dosing via capsules using 50 milligram (mg), 75 mg, 110 mg, and 150 mg capsules. Patients aged < 8 years or for patients who cannot take capsules even if older than 8 (but < 12 years of age): age- and weight-adjusted dosing via DE pellets. Patients aged < 12 months: age- and weight-adjusted dosing via DE oral liquid formulation (OLF).

Serious adverse events	Standard of care	Dabigatran etexilate	
Total subjects affected by serious adverse events			
subjects affected / exposed	18 / 90 (20.00%)	25 / 176 (14.20%)	
number of deaths (all causes)	2	2	
number of deaths resulting from adverse events	0	0

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
02 October 2014	With Global Amendment 1, recruitment of patients with a body weight ≥ 40 kg was temporarily suspended. It was projected that, because of the performed capping of the maximum single starting dose at 220 mg, a considerable proportion of patients with a body weight ≥ 40 kg will have dabigatran plasma levels falling below 50 ng/mL.
28 January 2015	The age cut-offs for stratum 2 and 3 were changed based on the EMA PDCO opinion dated 29 Sep 2014. A twice daily dosing regimen using actual calculated dosages (according to Hayton equation) was implemented. It was clarified that patients aged 6 months to < 8 years and those who cannot take capsule at an age of 8 to < 12 years were to receive pellets, and that patients aged 0 to < 6 months and those who cannot take pellets at an age of 6 to < 12 months were to receive OLF. In the benefit-risk section of the CTP, information on the Phase IIa trials was updated as these trials were a prerequisite for opening the second age group (2 to < 12 years). An additional exclusion criterion was introduced: Patients in age group 0 to < 2 years with gestational age at birth < 37 weeks or with a body weight lower than the 3rd percentile (according to the WHO Child growth standards) were not to be entered in the trial. It was clarified that all patients who continued treatment for VTE, regardless of whether this was a switch from DE to SoC or from one SoC to another, are not considered early discontinued. A more detailed and age-specific description of the blood sample volumes collected during the trial was added.
26 November 2015	The up-titration dosing nomograms for capsules and pellets were updated to correct calculation errors. It was stated that the OLF dosing nomograms will need to be updated as well in advance of opening the youngest age group (0 to < 2 years).
16 March 2016	The assessment of thrombus extension at Visit 5 was removed from the CTP, to better reflect the clinical routine for follow-up of patients with VTE and to eliminate potential unwarranted radiation exposure. A summary of Phase I bioavailability trial 1160.194 was added to provide background information for considering DE formulations to be used interchangeable, without the need for a conversion factor. It was clarified that patients requiring VTE therapy beyond 3 months have to be switched at Visit 8 (Day 84) to SoC treatment (if randomised to DE) or continue SoC treatment (if randomised to the SoC arm) and could be treated with SoC during the follow-up period. Randomisation in a 1:1 ratio to an OLF with either a flavoured or an unflavoured solvent for reconstitution was introduced. It was clarified that eGFR retesting was allowed once during the screening period. The criterion when to remove patients from the trial because of low eGFR was decreased to < 50 mL/min/1.73m ² . The 150 mg DE capsule was introduced to reduce the number of capsules taken by patient at a single time point. It was explained that in case of gastrointestinal symptoms, DE was to be taken with a meal or concomitantly with a proton pump inhibitor. In the inclusion criteria, it was added that a temporary interruption of the anticoagulant therapy for the index VTE event or prior to the start of secondary VTE prophylaxis was acceptable, if one of the defined pre-requisites was met.

29 November 2016	The sample size was reduced from a minimum of 240 to a minimum of 180 evaluable patients for the efficacy component of the co-primary endpoint. The duration of the follow-up period was reduced from 9 months to 1 month after the last intake of trial medication. It was clarified that freedom from thrombus progression at the end of therapy (Day 84 after randomisation or eEOT whichever comes first) will be assessed in comparison with baseline. It was clarified that pre-treatment with VKAs during the initial parenteral treatment was acceptable if the INR had not reached a therapeutic level (INR <2.0) at the time of randomisation. To facilitate an expedited evaluation of the risk of bleeding in patients <2 months of age, the first trough dabigatran concentration assessment (at Visit 3) was required to be supplemented by a local aPTT measurement for patients <2 months and a baseline aPTT was also required to be available for these patients. The final results of the completed Phase IIa PK/PD trials relevant for the patients to be included in second age group (2 to <12 years) and in youngest age group (0 to <2 years) were provided. The eGFR threshold for exclusion from the trial was changed to <60 mL/min/1.73m ² for patients aged 12 to <18 years. The recommendation to use a proton pump inhibitor such as pantoprazole in case of development of gastrointestinal symptoms was replaced by the recommendation to use a proton pump inhibitor according to the local SoC in accordance with local labelling recommendations. To reflect the sequential introduction of age appropriate formulations (and OLF in particular), it was clarified that patients in age group 2 to <12 years are to be entered and treated considering the availability of the age appropriate DE formulations. The analysis set for PK analyses was defined. It was clarified that interim analyses based on selected or partial clinical trial data may be conducted for regulatory purposes.
30 October 2017	The sample size was further reduced from a minimum of 180 to a minimum of 141 evaluable patients for the efficacy primary endpoint, but it was clarified that the recruitment of further patients could be continued if required by regulatory authorities. Based on FDA advice, freedom from major bleeding events was changed from the coprimary safety endpoint to a secondary endpoint. Fondaparinux was added as allowed SoC treatment based on therapeutic guidelines and EMA advice. The flow chart was amended with several clarifications regarding visit windows, the collection of post-dose samples, and follow-up periods.
16 January 2018	Active meningitis, encephalitis, and intracranial abscess at Visit 2 were added as exclusion criteria. Furthermore, patients who developed active meningitis, encephalitis, or intracranial abscess were to be discontinued from the trial medication.
11 September 2018	The option to administer pellets was expanded to patients <6 months of age. A preference for usage of OLF over pellets in patients <12 months of age, provided that OLF supplies are available to the site, was implemented. The time window from Visit 1 (screening) to Visit 2 (first administration of trial medication) was expanded to 21 days to facilitate screening procedures. It was clarified that the discontinuation from trial medication is required if a drug-related SAE occurred. It was added that the type of SoC may be changed during the treatment period in patients randomised to SoC. The wording of several secondary endpoints was modified to clarify the meaning
06 February 2019	The eGFR threshold in exclusion criterion 2 was lowered to <50 mL/min/1.73 m ² for all patients, irrespective of their age.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
