Analysis stage	Final
Date of interim/final analysis	17 June 2015
Is this the analysis of the primary completion data?	Yes
Primary completion date	17 June 2015
Global end of trial reached?	Yes
Global end of trial date	17 June 2015
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary objective is to assess the efficacy of sublingual immunotherapy with the allergoid LAIS® Birch-Alder tablets by the Total Combined Score (TCS) taking in account the Rhinoconjunctivitis Total Symptom Score (RTSS) of the six rhinoconjunctivitis symptoms (sneezing, rhinorrhea, nasal pruritus, nasal congestion, ocular pruritus and watery eyes and the Total Rescue Medication Score (TRMS) for the peak of the birch pollen season.

Protection of trial subjects:

Moreover, the main procedures used to guarantee the subject's anonymity especially during the analysis of their personal data were profoundly explained. The investigator also informed the patient of the possible risks linked to the administration of the product and the possible side effects which to his/her knowledge might occur. The patient was invited to ask questions which were answered by the responsible investigator until the patient was entirely satisfied. Before asking the patient to sign the consent form, the investigator ascertained that the patient had understood entirely and agreed to all information provided. Afterwards, a written Patient Informed Consent Form (ICF) and a Patient Information Form (which were previously approved by the leading ethics committee and notified to the local ethics committees) were handed over to the patient. Two copies of the ICF were to be dated and signed by the patient and the investigator, of which one copy was handed out to the patient. The second form was kept confidentially in the investigator's file. The subject's signature verified his/her agreement of participation in the trial. In agreement with the subject, the investigator informed the subject's regular physician of his/her participation in the trial.

Background therapy:

The intake of anti-symptomatic medication appropriate to an escalation scheme:

Rescue medications :

- Antihistamine (oral)
- Additional Levocabastine (eyedrops)
- Additional Beclomethasone (nasal)

Evidence for comparator: -

Actual start date of recruitment	04 November 2013
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Germany: 235
Worldwide total number of subjects	235
EEA total number of subjects	235

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	235
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

Eligible subjects were assigned to one of the two treatment groups using a randomization list that was generated on the basis of subject identifiers by a randomization program. It was planned that each treatment group should consist of 120 patients.

Pre-assignment

Screening details:

Female or male patients aged 18 to 75 years with a history of at least two years of tree pollen induced allergic rhinitis and/or allergic rhinoconjunctivitis with or without seasonal controlled allergic asthma.

Period 1

Period 1 title	Tree pollen (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Investigator, Monitor, Data analyst, Subject

Arms

Are arms mutually exclusive?	Yes
Arm title	Placebo

Arm description: -

Arm type	Placebo
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Sublingual tablet
Routes of administration	Sublingual use

Dosage and administration details:

Placebo and verum preparations were identical except of the active substances (carbamylated, monomeric allergoids of birch and alder).

Arm title	LAIS® Birch-Alder tablets
------------------	---------------------------

Arm description:

LAIS® Birch-Alder tablets in a dosage of 1000 UA or placebo. Daily intake of one sublingual tablet.

Arm type	Experimental
Investigational medicinal product name	LAIS® Birch-Alder tablets
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Sublingual tablet
Routes of administration	Sublingual use

Dosage and administration details:

Each patient was instructed to take one sublingual tablet per day, to place it under the tongue and to let it dissolve for two minutes before swallowing. During the treatment phase, the participant received either a daily dosage of 1,000 UA monomeric allergoid LAIS® Birch-Alder tablets or placebo according to the randomization-schedule.

The study foresaw an intake of IMP over 12 weeks pre-seasonally (cumulative dose of 84,000 UA) and 8 weeks co-seasonally. Delays in study approvals and patients' recruitment moved forward the treatment. therefore the maximum pre-seasonally cumulative dose in the actively treated group amounted to 70,000 UA in only 25% of patients; 50% of the patients received a cumulative dose of only 63,000 UA and 25% of only 56,000 UA. Considering the early appearance of other cross reactive trees and the high number of subjects cosensitized, the pre-seasonal phase scheduled, important to switch on the therapeutic effect, can be considered absent for most subjects.

Number of subjects in period 1^[1]	Placebo	LAIS® Birch-Alder tablets
Started	96	92
Completed	94	88
Not completed	2	4
Consent withdrawn by subject	1	1
Adverse event, non-fatal	1	-
lack of Compliance	-	1
Missing at V4	-	1
concomitant disease	-	1

Notes:

[1] - The number of subjects reported to be in the baseline period are not the same as the worldwide number enrolled in the trial. It is expected that these numbers will be the same.

Justification: Number of screened population is 235, while before randomization 47 subjects did not pass the screening procedures resulting as screening failure.

Baseline characteristics

Reporting groups

Reporting group title	Placebo
Reporting group description: -	
Reporting group title	LAIS® Birch-Alder tablets
Reporting group description: LAIS® Birch-Alder tablets in a dosage of 1000 UA or placebo. Daily intake of one sublingual tablet.	

Reporting group values	Placebo	LAIS® Birch-Alder tablets	Total
Number of subjects	96	92	188
Age categorical Units: Subjects			
Female or male adults (18 to 75) years	96	92	188
Age continuous Units: years

Gender categorical Units: Subjects			
Female	61	50	111
Male	35	42	77

Subject analysis sets

Subject analysis set title	Safety set (S-set)/ Exposed Subjects
Subject analysis set type	Safety analysis

Subject analysis set description:

The safety population included all randomized subjects who have been exposed to the study medication at least once and consisted of 188 patients. Of these, 96 patients (51.1%) were assigned to the placebo-group and 92 patients (48.9%) received 1,000 UA/d

Subject analysis set title	Intention-To-Treat-set (ITT-set)/Evaluable Subjects
Subject analysis set type	Intention-to-treat

Subject analysis set description:

The ITT-set comprised all randomized subjects who met key eligibility and evaluability criteria according to the study protocol. Since the primary objective of this trial was the assessment of the efficacy of the sublingual therapy on the basis of the TCS during the peak pollen season, a complete set of diary data was the main criterion for inclusion into the ITT-set. In the case of missing data, the Last-Value-Carry-Forward-Option was applied.

Subject analysis set title	Per-Protocol-set (PP-set)
Subject analysis set type	Per protocol

Subject analysis set description:

Patients who met all criteria in the protocol and delivered a complete data set of measurements and evaluations of the primary efficacy variable were allocated to the PP-set.

Method	Asymp. Sig. (2-tailed)

Secondary: TCS 60 days

End point title	TCS 60 days
End point description: In the experimental design used, the efficacy of the SLIT with the Lais Birch-Alder tablets was not confirmed in this trial. Multiple deviations occurred with heavy alteration of the clinical/methodological setting and a consequent adherence of the results to the expectations based on the original	

experimental model. Therefore, the conclusions of the study do not imply the product is basically ineffective when used and investigated in proper setting and experimental model.

It is assumed that a sufficient pre-seasonal period before the onset of the pollen season is necessary to permit immunotherapy the consolidation of its therapeutic action, different from common drugs and based on a progressive immunostimulation redirecting the immune system toward tolerance, before the initiation of the natural pollen exposure. In this study, the pre-seasonal phase of the treatment schedule, important to switch on the therapeutic effect, can be considered absent for most subjects.

End point type	Secondary
----------------	-----------

End point timeframe:

60 days. Assess the efficacy of a sublingual immunotherapy with the allergoid LAIS® Birch-Alder tablets related to the TCS) for the or the entire pollen season of 60 days (March and April).

Comparison groups	Placebo v LAIS® Birch-Alder tablets

Number of subjects included in analysis	182
Analysis specification	Pre-specified
Analysis type	superiority ^[3]
P-value	= 0.497
Method	Asymp. Sig. (2-tailed)

Notes:

[3] - 1) At baseline most of the patients exhibited low reactivity to the CPT with birch pollen extract, by reacting to highest concentrated provocation solution thus preventing a fine assessment of the subsequent improvement.

2) The change in the allergic severity S in the CPT between baseline and final visit was statistically significant within each of the both treatment groups, respectively.

Secondary: CPT result score

End point title	CPT result score
-----------------	------------------

End point description:

The changes of the threshold allergen concentration for a positive CPT between baseline and V5 were analyzed by means of the CPT result score. Regarding that a higher threshold for a positive CPT meant a lower allergic reactivity, a negative reaction to the CPT was rated as "0". A positive reaction at the highest threshold of 10,000 SQ/ml was rated as "1", a positive reaction at the threshold of 1,000 SQ/ml as "2" and positive reaction at the threshold of 100 SQ/ml as "3". The changes of the threshold allergen concentration for a positive CPT were allocated to the following three categories: "improved", "unchanged" or "worse" depending on whether a higher, the same or a lower allergen concentration was administered for a positive CPT at V5 compared to baseline, respectively.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
18 February 2014	<p>Originally, the study was planned to last from November 2013 to the end of April 2014, consisting of the screening visit V0, five visits (V1-V5) during the treatment period, and one post-seasonal termination visit (V6). The intake of study medication (verum or placebo) was planned to last 20 weeks</p> <p>There was one substantial amendment of the study protocol version 3.0 prior to the start of the trial concerning the conduct of the study resulting in study protocol version 3.1. Due to a delay, the initiations of the investigator sites started in December instead of November 2013. Therefore the initially planned study duration of 20 weeks was shortened to 84 ± 14 days (12 ± 2 weeks). Visit 6 was cancelled and the intervals between V1 and V4 (56 ± 7 days) as well as V1 and V5 (84 ± 14 days) were newly determined. Diaries and rescue medication were handed out at visit V3 instead of visit V4. Visit 5 was defined as the termination visit at the end of the tree pollen season, containing all parameters to be checked from the former visit 6.</p>
28 March 2014	<p>A second substantial amendment of the study protocol was necessary due to the delayed start of the trial in combination with an expected early birch pollen season in 2014 based on the mild winter 2013/14. This amendment resulted in study protocol version 3.2. Instead of time intervals between V1 and V4 as well as V1 and V5, respectively, calendar weeks were determined for V4 (week 10 to 12, 10.03.2014 - 21.03.2014) and V5 (week 18 to 19, 28.04.2014 - 09.05.2014). Therefore, the study terminated at the latest in May 2014. Due to an unforeseen shortage of CPT-allergen solution announced in early January 2014 by the manufacturer ALK-Abello, the CPT at V3 was optional depending on sufficient allergen solution available</p>
03 December 2014	<p>In versions 3.0 to 3.2 of the study protocol it was planned to assess the TCS for the peak 30 days of the birch pollen season with a pollen count of at least "moderate" (stage 2 according to Deutscher Wetterdienst Medizin-Meteorologie). However, this 30 day peak was identical with the entire birch pollen season from end of March till end of April in Germany in 2014. Since the peak birch pollen season in 2014 lasted 14 days in all areas of Germany with a constant high pollen concentration (stage 3 according to Deutscher Wetterdienst Medizin-Meteorologie), it was decided in the blind review meeting to finally evaluate the primary efficacy variable for those 14 consecutive days at the centre with the highest local birch pollen counts (amendment 3 resulting in study protocol version 3.3). We specified the peak of the birch pollen season as 14 consecutive days with a "high" pollen count and used three analysis periods to distinguish between the peak of the birch pollen season and the entire season:</p> <p>Therefore, the TCS for the birch pollen season of 30 days as well as the RTSS, the six individual symptom scores of the RTSS and the TRMS for the peak birch pollen season of 14 days were evaluated as secondary parameters.</p>

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats
