Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	27 May 2014
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	01 April 2014
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary objective is to evaluate the efficacy and safety of the addition of UMEC 125 mcg to FF/VI 100/25 mcg once-daily and the addition of UMEC 62.5 mcg to FF/VI 100/25 mcg once-daily, compared with placebo plus FF/VI 100/25 once-daily over 12 weeks in subjects with COPD.

Protection of trial subjects:

Spirometry procedures may cause difficulty breathing, changes in pulse rate/blood pressure, coughing, wheezing, chest tightness, or fainting. Subjects (sub.) will be monitored during the procedure for these effects, and spirometry will be discontinued if this occurs. Skin irritation is rare but could occur during ECG from the electrodes. It may be necessary to shave small patches of hair to properly attach electrodes. Sub. will be monitored during the procedure for these effects and should call their study doctor if effects do not resolve. Side effects of albuterol/salbutamol include shakiness, headache, sleeplessness, high blood pressure, heart beating fast/irregular beats, cough, wheezing, shortness of breath, increased fluid in the mouth, nausea, upset stomach, tiredness, anxiety/nervousness, or low blood potassium. Sub. should call their study doctor if they experience any of these symptoms. Sub. with poorly controlled COPD/experience an exacerbation of COPD during the run-in period will not be randomized. ICS/LABA combination therapy is associated with an increased risk of pneumonia but no other significant side effects in COPD. Sub. with a lower respiratory tract infection that required the use of antibiotics within 6 weeks prior to Visit 1 are excluded from the study in order to ensure patient safety. LABAs may increase the risk of asthma-related death. Sub. with a current diagnosis of asthma will be excluded from study participation. Cardiovascular effects such as cardiac arrhythmias, e.g., supraventricular tachycardia and extrasystoles, are also class effects associated with LABAs and LABA-containing therapy. Exclusion criteria have been set for sub. with uncontrolled or severe cardiovascular disease according to the PI's opinion where the potential risk may outweigh the benefit. The Investigator should also determine the clinical significance of abnormal ECG findings at screening and exclude sub. who would be at undue risk by participating in the trial.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	04 October 2013
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Romania: 117
Country: Number of subjects enrolled	United States: 197
Country: Number of subjects enrolled	Chile: 150
Country: Number of subjects enrolled	Canada: 150
Country: Number of subjects enrolled	Argentina: 113
Worldwide total number of subjects	727
EEA total number of subjects	117

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	369
From 65 to 84 years	355
85 years and over	3

Subject disposition

Recruitment

Recruitment details:

Participants ≥ 40 years of age with history of chronic obstructive pulmonary disease (COPD) and a smoking history of ≥ 10 pack-years were enrolled in the study. Participants completed a 4-week run-in period, in which they received fluticasone furoate 100 micrograms(μg)/vilanterol 25 μg , followed by a 12-week treatment period and 1-week follow-up.

Pre-assignment

Screening details:

A total of 619 participants (pars.) were randomized to study treatment and comprised the Intent-to-Treat (ITT) Population (participants randomized to treatment who received ≥ 1 dose of randomized study medication in the treatment period).

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Investigator, Monitor, Data analyst, Carer, Assessor, Subject

Arms

Are arms mutually exclusive?	Yes
Arm title	Fluticasone furoate/vilanterol 100/25 μg + placebo

Arm description:

Participants received one inhalation of fluticasone furoate (FF)/vilanterol (VI) 100/25 μg once-daily (OD) via a dry powder inhaler (DPI), followed by one inhalation of umeclidinium bromide (UMEC) matching placebo, administered via a dry powder inhaler in the morning for 12 weeks. In addition, participants were provided supplemental albuterol/salbutamol inhalation aerosol to be used as needed throughout the study, for symptomatic relief from COPD symptoms.

Arm type	Placebo
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Inhalation powder
Routes of administration	Inhalation use

Dosage and administration details:

Matching placebo

Investigational medicinal product name	Fluticasone furoate/vilanterol

Notes:

[1] - The number of subjects reported to be in the baseline period are not the same as the worldwide number enrolled in the trial. It is expected that these numbers will be the same.

Justification: The baseline period includes only those enrolled participants who were randomized to treatment and received ≥ 1 dose of randomized study medication in the Treatment Period (n=619).

Primary: Change from Baseline (BL) in trough forced expiratory volume in one second (FEV1) at Day 85

End point title	Change from Baseline (BL) in trough forced expiratory volume in one second (FEV1) at Day 85
End point description: FEV1 is a measure of lung function and is defined as the maximal amount of air that can be forcefully exhaled in one second. Trough FEV1 on Day 85 is defined as the mean of the FEV1 values obtained 23 and 24 hours after dosing on Day 84. Analysis was performed using a mixed model repeated measures (MMRM) with covariates of treatment, Baseline FEV1, smoking status, Day, treatment, Day by baseline interaction and Day by treatment interaction, Day being nominal. Baseline FEV1 is the mean of the two assessments made at 30 and 5 minutes (min) pre-dose on Day 1. The change from baseline value is the difference between the on-treatment value and the baseline value. The number of participants presented represent those with data available at the time point being presented; however, all participants in the Intent-to-Treat (ITT) Population without missing covariate information and with at least one post baseline measurement are included in the analysis.

Secondary: Change from Baseline in 0-6 hour weighted mean (WM) FEV1 obtained

post-dose at Day 84

End point title	Change from Baseline in 0-6 hour weighted mean (WM) FEV1 obtained post-dose at Day 84
-----------------	---

End point description:

FEV1 is a measure of lung function and is defined as the maximal amount of air that can be forcefully exhaled in one second. The 0-6 hour weighted mean was derived by calculating the area under the FEV1/time curve over the nominal time points of 0 hour (trough value), 15 and 30 min, 1, 3 and 6 hours, using the trapezoidal rule, and then dividing by the actual time between dosing and the 6 hour assessment. Analysis was performed using MMRM with covariates of treatment, Baseline FEV1 (mean of the two assessments made 30 minutes and 5 minutes pre-dose on Day 1), smoking status, Day, and Day by Baseline and Day by treatment interactions. Baseline FEV1 is the mean of the two assessments made at 30 and 5 min pre-dose on Day 1. The change from baseline value is the difference between the on-treatment value and the baseline value. All participants in the ITT Population without missing covariate information and with at least one post baseline measurement are included in the analysis.

Adverse events

Adverse events information

Timeframe for reporting adverse events:

On-treatment serious adverse events (SAEs) and non-serious adverse events (AEs) were collected from start of study medication until follow-up visit (up to 14 weeks).

Adverse event reporting additional description:

On-treatment SAEs and non-serious AEs are reported for members of the ITT Population, comprised of all participants randomized to treatment who received at least one dose of randomized study medication in the treatment period.
