Global end of trial reached?	Yes	
Global end of trial date	28 April 2015	
Was the trial ended prematurely?	No	

General information about the trial

Main objective of the trial:

To determine the efficacy, long-term safety, and tolerability of alirocumab 300 mg every 4 weeks (Q4W), in comparison with placebo, as well as its potential as a starting regimen.

The dose regimen of 75 mg every 2 weeks (Q2W), as used in other studies, was added as a calibrator.

Protection of trial subjects:

This study was conducted in accordance with the ethical principles that have their origin in the Declaration of Helsinki and that are consistent with the International Conference on Harmonisation (ICH) guidelines for Good Clinical Practice (GCP) and applicable regulatory requirements.

Background therapy:

The study was conducted in 2 separate populations concurrently: subjects receiving concomitant statin therapy and subjects not receiving concomitant statin therapy.

Subjects receiving concomitant statin were to receive stable daily doses of rosuvastatin, atorvastatin, or simvastatin for at least 4 weeks.

Background treatment with other lipid-modifying therapy (LMT) was allowed for all patients, provided they had been on a stable dose for at least 4 weeks (6 weeks for fenofibrate) prior to study entry.

Evidence for comparator: -	
Actual start date of recruitment	25 September 2013
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects	
Subjects enrolled per country	
Country: Number of subjects enrolled	Norway: 17
Country: Number of subjects enrolled	Slovakia: 50
Country: Number of subjects enrolled	United Kingdom: 63
Country: Number of subjects enrolled	Bulgaria: 19
Country: Number of subjects enrolled	Hungary: 37
Country: Number of subjects enrolled	Canada: 27
Country: Number of subjects enrolled	Israel: 14
Country: Number of subjects enrolled	United States: 576
Worldwide total number of subjects	803
EEA total number of subjects	186

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	518
From 65 to 84 years	282
85 years and over	3

Subject disposition

Recruitment

Recruitment details:

The study was conducted at 97 sites in 8 countries. A total of 1491 subjects were screened between September 2013 and April 2014, 688 of whom were screen failures. Screen failures were mainly due to inclusion criteria not met.

Pre-assignment

Screening details:

Randomization was stratified according to statin therapy (with/ without) and cardiovascular risk (moderate vs. high/very high) within the population receiving concomitant statin. Assignment to treatment arms was done using an Interactive Voice/Web Response System in 2:1:4 (Placebo: 75 mg: 300 mg) ratio after confirmation of selection criteria.

Period 1	Period 1	
Period 1 title	Overall Study (overall period)	
Is this the baseline period?	Yes	
Allocation method	Randomised - controlled	
Blinding used	Double blind	
Roles blinded	Subject, Investigator, Carer, Assessor	
Arms		
Are arms mutually exclusive?	Yes	
Arm title	Placebo Q2W with Concomitant Statin	
Arm description:		
Two Subcutaneous (SC) injections of platherapy for 48 weeks.	acebo (for alirocumab) every two weeks (Q2W) with stable statin	
Arm type	Placebo	
Investigational medicinal product name	Placebo (for Alirocumab)	
Investigational medicinal product code		
Other name		

Dosage and administration details:

Placebo matched to alirocumab administered as a SC injection of 1 mL into the abdomen, thigh, or outer area of the upper arm.

Subcutaneous use

Solution for injection in pre-filled syringe

Alirocumab 75 mg Q2W/Up 150 mg Q2W with Concomitant Statin

Arm description:

Pharmaceutical forms

Routes of administration

One SC injection of each Alirocumab 75 mg and placebo Q2W with stable statin therapy for 48 weeks. Alirocumab dose up-titrated to 150 mg every two weeks (Q2W) from Week 12 when LDL-C levels \geq 70 mg/dL (1.81 mmol/L) (for very high CV risk subjects) or \geq 100 mg/dL (2.59 mmol/L) (for moderate and high CV risk subjects) at Week 8.

Arm type	Experimental
Investigational medicinal product name	Alirocumab
Investigational medicinal product code	REGN727, SAR236553
Other name	Praluent
Pharmaceutical forms	Solution for injection in pre-filled syringe
Routes of administration	Subcutaneous use

Dosage and administration details:

Alirocumab administered as a SC injection of $1\ mL$ into the abdomen, thigh, or outer area of the upper arm.

Analysis)[1]

End point description:

Adjusted least squares (LS) means and standard errors at Week 24 and at averaged Week 21 to 24 were obtained from a mixed effect model with repeated measures (MMRM) model to account for missing data. All available post-baseline data from Week 4 to Week 24 regardless of status on- or off-treatment were used in this model (ITT analysis). ITT population (subjects with concomitant statin therapy): all randomized subjects who received concomitant statin therapy, with one baseline and at least one postbaseline calculated LDL-C value on- or off-treatment. Alirocumab 75 mg Q2W arm (calibrator arm) was included only to facilitate comparison of results of this study with the results of other studies that used an alirocumab 75 mg Q2W regimen. Hence no statistical comparison was performed for this arm.

End point type	Primary

Statistical analysis description:

A hierarchical testing procedure was used to control type I error and handle multiple secondary endpoint analyses. Testing was then performed sequentially in the order the endpoints are reported. The hierarchical testing sequence continued only when previous endpoint was statistically significant at 0.025 level.

Adverse events

Adverse events information

Timeframe for reporting adverse events:

All Adverse Events (AE) were collected from signature of the informed consent form up to the final visit (Week 56 post-treatment follow-up visit) regardless of seriousness or relationship to investigational product.

Adverse event reporting additional description:

Reported adverse events are treatment-emergent adverse events that is AEs that developed/worsened during the 'treatment-emergent period' (the time from the first dose of study drug up to the last dose of study drug +70 days).

Bronchitis			
subjects affected / exposed	12 / 229 (5.24%)	7 / 115 (6.09%)	19 / 458 (4.15%)
occurrences (all)	12	7	24
Urinary tract infection			
subjects affected / exposed	10 / 229 (4.37%)	7 / 115 (6.09%)	28 / 458 (6.11%)
occurrences (all)	12	7	31
Sinusitis			
subjects affected / exposed	11 / 229 (4.80%)	4 / 115 (3.48%)	28 / 458 (6.11%)
occurrences (all)	12	4	31
Upper respiratory tract infection			
subjects affected / exposed	18 / 229 (7.86%)	8 / 115 (6.96%)	41 / 458 (8.95%)
occurrences (all)	19	9	53

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
10 October 2013	- The upper limit of LDL-C was changed from 190 mg/dL to 160 mg/dL for subjects at moderate CVD risk, for consistency with Adult Treatment Panel (ATP) III guidelines The term "statin inappropriate" was replaced with "statin intolerant", to ensure the appropriate study population was enrolled. A definition for statin intolerance had been added The definitions for moderate, high, and very high CVD risk were added for clarity.
26 August 2014	- Primary efficacy single endpoint within each concomitant statin therapy population was modified (i.e, subjects who received concomitant statin therapy and subjects who did not receive concomitant statin therapy) to co-primary (i.e, 2) efficacy endpoints. - Efficacy alpha level was not adjusted in this study for the 2 co-primary endpoints, since study was to be considered positive within a given concomitant statin population if statistical significance was met for both co-primary endpoints. - The primary efficacy analysis population was modified to ITT population for the primary and secondary efficacy endpoints, which included assessments both on-and off- study treatment through analysis period. - Statistical methodology for primary and secondary efficacy analysis endpoints was modified as follows: An MMRM was to be used for 2 co-primary endpoints and for other continuous secondary endpoints anticipated to have normally distributed data; For continuous endpoints expected to had non-normally distributed data, robust regression method was to be used to test treatment group differences and missing data was to be handled using multiple imputation approach; For binary endpoints, logistic regression method was to be used to test treatment group differences and missing data was to be handled using multiple imputation approach. - Specified further the sensitivity analyses that was to be performed on primary efficacy endpoint. - Primary and key secondary endpoints was also to be analyzed in mITT population to assess drug effect during the study treatment period (on-treatment approach). - The list of key and other secondary efficacy endpoints and estimands (ITT estimand or on-treatment estimand) were adjusted. - Clarified that LDL-C, measured and calculated, was to be performed at weeks 0 and 24.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
