

Clinical trial results:

A randomized, double-blind, phase III multi-center study to evaluate the safety and efficacy of BF-200 ALA (Ameluz®) versus placebo in the field-directed treatment of mild to moderate actinic keratosis with photodynamic therapy (PDT) when using BF-RhodoLED®

Due to the EudraCT – Results system being out of service between 31 July 2015 and 12 January 2016, these results have been published in compliance with revised timelines.

Summary

EudraCT number	2013-002510-12

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	03 September 2014
Is this the analysis of the primary completion data?	Yes
Primary completion date	15 August 2014
Global end of trial reached?	Yes
Global end of trial date	15 August 2014
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary objective of the study was to compare the efficacy of BF-200 ALA (Ameluz) with placebo, for the field-directed treatment of mild to moderate AK with PDT when using the BF RhodoLED® lamp.

Protection of trial subjects:

- During PDT, i.e. during illumination the patient wore suitably protective goggles
- Pain prevention (if the pain was regarded as unbearable by the patient):
 - * Cooling with an air stream or with nebulized water
 - * Short interruption of the illumination to inject a local fast-acting anesthetic such as xylocaine
 - * After PDT the treated areas could be cooled with wet or refrigerated compresses
 - * Analgesic treatment with paracetamol or metamizol
- Non- or partial responders received treatment of new or recurrent lesions with conventional therapy at the discretion of the investigator after the end of the observer-blind part

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	04 October 2013
Long term follow-up planned	Yes
Long term follow-up rationale	Efficacy, Safety
Long term follow-up duration	12 Months
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Germany: 94
Worldwide total number of subjects	94
EEA total number of subjects	94

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0

Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	15
From 65 to 84 years	79
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

Trial was conducted in Germany with 7 study sites (Bonn, Dresden, Munich, Wuppertal, Mönchengladbach, Cologne, and Recklinghausen) who recruited patients.

Pre-assignment

Screening details:

94 patients were screened, 87 patients were randomized (55 patients to BF-200 ALA and 32 patients to placebo) and treated. 7 patients were screening failures: 3 withdrew consent, 2 did not meet the in-/exclusion criteria, and 2 failed for other reasons (recruitment stop).

Pre-assignment period milestones

Number of subjects started	94
Number of subjects completed	87

Pre-assignment subject non-completion reasons

Reason: Number of subjects	Consent withdrawn by subject: 3
Reason: Number of subjects	Recruitment stop: 2
Reason: Number of subjects	Did not meet in-/exclusion criteria: 2

Period 1

Period 1 title	Observer blind part (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Data analyst

Blinding implementation details:

- Verum and placebo are indistinguishable.
- To guarantee the blind status of the investigator assessing efficacy after each PDT session, a second investigator or delegated person performs the PDT and conducts all safety evaluations during the PDT and the telephone call 1 week after PDT (observer-blind design).
- The randomization schedule and the allocation to treatment groups will not be known to the investigator and the sponsor until completion of the study, except in case of an emergency.

Arms

Are arms mutually exclusive?	Yes
Arm title	Verum
Arm description: -	
Arm type	Experimental
Investigational medicinal product name	Ameluz 78 mg/g gel
Investigational medicinal product code	BF-200 ALA
Other name	5-aminolevulinic acid nanoemulsion
Pharmaceutical forms	Gel
Routes of administration	Topical use

Dosage and administration details:

After lesion preparation, the entire content of 1 tube of verum was applied to the treatment fields identified for this study at screening. The verum was applied to the entire field(s) covering a size of approx. 20 cm² with a film of about 1 mm thickness. Application near the eyes, nostrils, mouth, ears, or mucosa was to be avoided (by a distance of 1 cm). After application, the IMP was allowed to dry for approx. 10 minutes before an occlusive light-tight dressing was placed over the treatment site. Following incubation of 3 hours (+/- 10 minutes) the dressing was removed and the remnant gel wiped off with a 0.9% saline solution. Thereafter illumination was performed using BF-RhodoLED lamp (635

nm) applying a total light dose of 37 J/cm² (per treated field). During illumination, the lamp was fixed at a distance of 5 to 8 cm from the skin surface as indicated in the user manual. This treatment was performed once and repeated after 12 weeks if no complete response was observed.

Arm title	Placebo
Arm description: -	
Arm type	Placebo
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Gel
Routes of administration	Topical use

Dosage and administration details:

After lesion preparation, the entire content of 1 tube of placebo was applied to the treatment fields identified for this study at screening. The placebo was applied to the entire field(s) covering a size of approx. 20 cm² with a film of about 1 mm thickness. Application near the eyes, nostrils, mouth, ears, or mucosa was to be avoided (by a distance of 1 cm). After application, the IMP was allowed to dry for approx. 10 minutes before an occlusive light-tight dressing was placed over the treatment site. Following incubation of 3 hours (+/- 10 minutes) the dressing was removed and the remnant gel wiped off with a 0.9% saline solution. Thereafter illumination was performed using BF-RhodoLED lamp (635 nm) applying a total light dose of 37 J/cm² (per treated field). During illumination, the lamp was fixed at a distance of 5 to 8 cm from the skin surface as indicated in the user manual. This treatment was performed once and repeated after 12 weeks if no complete response was observed.

Number of subjects in period 1^[1]	Verum	Placebo
Started	55	32
Completed	54	26
Not completed	1	6
Consent withdrawn by subject	-	5
Lost to follow-up	1	1

Notes:

[1] - The number of subjects reported to be in the baseline period are not the same as the worldwide number enrolled in the trial. It is expected that these numbers will be the same.

Justification: 94 subjects were screened but only 87 subjects entered the baseline period. The other 7 subjects were screening failures. Thus the subject numbers of the baseline period and the worldwide number of subjects are not equal.

Primary: Overall patient complete response 12 weeks after the last PDT

End point title	Overall patient complete response 12 weeks after the last PDT
End point description:	
All efficacy variables were evaluated for the FAS. The primary efficacy variable was also analyzed for the PP population. All subgroup analyses were carried out for the FAS. Data for size and grade of AK lesions were analyzed using the last observation carried forward (LOCF) approach, affecting the response rates evaluation.	
Due to the small amount of missing data in the study, which did not have any relevant impact on primary results, sensitivity analyses for missing data were not performed.	
The primary efficacy variable was the overall patient complete response 12 weeks after the last PDT. An overall complete responder was defined as a patient in whom all treated AK lesions were cleared (Olsen score of 0) after the last PDT, i.e. after PDT 1 or after PDT 2 if re-treatment was performed.	
End point type	Primary
End point timeframe:	
12 weeks after PDT 1 or 12 weeks after PDT 2 which might have been necessary because not all lesions were cleared after the first PDT

Secondary: Patient histopathological confirmed response rate

End point title	Patient histopathological confirmed response rate
-----------------	---

End point description:

For the secondary confirmatory analysis, several superiority hypotheses were tested within a pre-defined hierarchic multiple testing procedure as described in the SAP.

The key secondary efficacy variables were tested strictly in a pre-defined order to ensure the FWER and the testing procedure had to be stopped once the first non-significant test was obtained.

The results of the confirmatory analysis are presented in the order pre-defined by the confirmatory testing procedure.

Assessments of HCR rates were based on the results from the biopsy taken 12 weeks after the last PDT from a representative AK lesion selected at screening. If the biopsy result for a patient revealed a residual AK, the patient was considered "not cleared" for the analysis irrespectively of the investigator's clinical assessment.

End point type	Secondary
----------------	-----------

Adverse events

Adverse events information

Timeframe for reporting adverse events:

04-Oct-2013 (first patient signed informed consent) until 03-Sep-2014 (data base lock)

Adverse event reporting additional description:

AEs expected to occur as local discomfort were reported via patient questionnaires, local skin reactions expected to occur were to be assessed by the assigned study team, any other AEs were to be reported by the patient or according to the assessment of the investigator.
